

Command Interface Guide

Version 2.3.0

Table of Contents

1. About This Document	4
1.1. Intended Audience	4
1.2. New and Changed Information	4
1.3. Notation Conventions	4
1.4. Comments Encouraged	7
2. Introduction	8
3. Install and Configure	9
3.1. Install trafci	9
3.2. Test trafci Launch	9
4. Launch trafci	10
4.1. Launch trafci on Windows Workstation	10
4.1.1. Create <code>trafci.cmd</code> Shortcut	11
4.2. Launch trafci on Linux Workstation	15
4.2.1. Set <code>trafci.sh</code> PATH	15
4.2.2. Preset the Optional Launch Parameters	16
4.3. Log In to Database Platform	17
4.3.1. Log In Without Login Parameters	17
4.3.2. Use Login Parameters	18
4.4. Retry Login	19
4.5. Optional Launch Parameters	22
4.6. Run Command When Launching trafci	24
4.7. Run Script When Launching trafci	26
4.8. Launch trafci Without Connecting to the Database	28
4.9. Run trafci With <code>-version</code>	29
4.10. Run trafci With <code>-help</code>	30
4.11. Exit trafci	30
5. Run Commands Interactively	31
5.1. User Interface	31
5.1.1. Product Banner	31
5.1.2. Interface Prompt	31
5.1.3. Break the Command Line	31
5.1.4. Case Sensitivity	33
5.2. Interface Commands	34
5.2.1. Show Session Attributes	34
5.2.2. Set and Show Session Idle Timeout Value	35
5.2.3. Customize the Standard Prompt	36
5.2.4. Set and Show the SQL Terminator	37
5.2.5. Display the Elapsed Time	38
5.2.6. Set and Show the Current Schema	39
5.2.7. Limit Query Result Set	40
5.2.8. Display Executed Commands	41

5.2.9. Edit and Reexecute a Command	42
5.2.10. Clear the Interface Window	43
5.2.11. Obtain Help	43
5.3. Run SQL Statements	44
5.3.1. Execute an SQL Statement	44
5.3.2. Repeat an SQL Statement	45
5.3.3. Prepare and Execute SQL Statements	46
5.3.4. Execute a Prepared SQL Statement	50
5.4. Log Output	54
5.4.1. Start the Logging Process	54
5.4.2. SPOOL <i>log-file</i> or LOG <i>log-file</i> Command	55
5.4.3. Stopping the Logging Process	56
5.4.4. View the Contents of a Log File	57
6. Run Scripts	58
6.1. Create a Script File	58
6.2. SQL Statements	58
6.3. Commands	58
6.4. Comments	58
6.5. Section Headers	59
6.6. Example Script File	59
6.7. Run a Script File	60
6.8. Log Output	61
6.9. Run Scripts in Parallel	62
7. Run trafci From Perl or Python	63
7.1. Set the Login Environment Variables	63
7.1.1. Set the Login Environment Variables on Windows	64
7.1.2. Set Login Environment Variables in the System Properties	64
7.1.3. Set the Login Environment Variables on Linux or UNIX	67
7.2. Perl and Python Wrapper Scripts	68
7.3. Launch trafci From the Perl or Python Command Line	68
7.3.1. Example Perl Program (<i>sample.pl</i>)	69
7.3.2. Example Python Program (<i>sample.py</i>)	70
8. Commands	71
8.1. @ Command	74
8.1.1. Syntax	74
8.1.2. Considerations	75
8.1.3. Examples	75
8.2. / Command	76
8.2.1. Syntax	76
8.2.2. Considerations	76
8.2.3. Example	76
8.3. ALIAS Command	77
8.3.1. Syntax	77
8.3.2. Considerations	77

8.3.3. Examples	78
8.4. CLEAR Command	79
8.4.1. Syntax	79
8.4.2. Considerations	79
8.4.3. Example	79
8.5. CONNECT Command	80
8.5.1. Syntax	80
8.5.2. Considerations	80
8.5.3. Examples	81
8.6. DELAY Command	82
8.6.1. Syntax	82
8.6.2. Considerations	82
8.6.3. Examples	82
8.7. DISCONNECT Command	83
8.7.1. Syntax	83
8.7.2. Considerations	83
8.7.3. Examples	84
8.8. ENV Command	85
8.8.1. Syntax	85
8.8.2. Considerations	85
8.8.3. Examples	86
8.9. EXIT Command	88
8.9.1. Syntax	88
8.9.2. Considerations	88
8.9.3. Examples	88
8.10. FC Command	90
8.10.1. Syntax	90
8.10.2. Considerations	91
8.10.3. Examples	91
8.11. GET STATISTICS Command	95
8.11.1. Syntax	95
8.11.2. Description of Returned Values	95
8.11.3. Considerations	95
8.11.4. Examples	96
8.12. GOTO Command	97
8.12.1. Syntax	97
8.12.2. Considerations	97
8.12.3. Examples	97
8.13. HELP Command	98
8.14. Syntax	98
8.14.1. Considerations	98
8.14.2. Examples	99
8.15. HISTORY Command	100
8.15.1. Syntax	100

8.15.2. Considerations	100
8.15.3. Example	100
8.16. IF...THEN Command	101
8.16.1. Syntax	101
8.16.2. Considerations	102
8.16.3. Examples	103
8.17. LABEL Command	104
8.17.1. Syntax	104
8.17.2. Considerations	104
8.17.3. Examples	104
8.18. LOCALHOST Command	105
8.18.1. Syntax	105
8.18.2. Considerations	105
8.18.3. Examples	105
8.19. LOG Command	107
8.19.1. Syntax	107
8.19.2. Considerations	108
8.19.3. Examples	109
8.20. OBEY Command	112
8.20.1. Syntax	112
8.20.2. Considerations	113
8.20.3. Examples	114
8.21. PRUN Command	118
8.21.1. Syntax	118
8.21.2. Considerations	119
8.21.3. Examples	120
8.22. QUIT Command	124
8.22.1. Syntax	124
8.22.2. Considerations	124
8.22.3. Examples	124
8.23. RECONNECT Command	126
8.23.1. Syntax	126
8.23.2. Considerations	126
8.23.3. Examples	126
8.24. REPEAT Command	127
8.24.1. Syntax	127
8.25. Considerations	127
8.25.1. Examples	128
8.26. RESET LASTERROR Command	130
8.26.1. Syntax	130
8.26.2. Considerations	130
8.26.3. Examples	130
8.27. RESET PARAM Command	131
8.27.1. Syntax	131

8.27.2. Considerations	131
8.27.3. Example	131
8.28. RUN Command	132
8.28.1. Syntax	132
8.28.2. Considerations	132
8.28.3. Example	132
8.29. SAVEHIST Command	133
8.29.1. Syntax	133
8.29.2. Considerations	133
8.29.3. Examples	133
8.30. SET COLSEP Command	135
8.30.1. Syntax	135
8.30.2. Considerations	135
8.30.3. Examples	135
8.31. SET FETCHSIZE Command	136
8.31.1. Syntax	136
8.31.2. Considerations	136
8.31.3. Examples	136
8.32. SET HISTOPT Command	137
8.32.1. Syntax	137
8.32.2. Considerations	137
8.32.3. Examples	138
8.33. SET IDLETIMEOUT Command	140
8.33.1. Syntax	140
8.33.2. Considerations	140
8.33.3. Examples	141
8.34. SET LIST_COUNT Command	143
8.34.1. Syntax	143
8.34.2. Considerations	143
8.34.3. Examples	143
8.35. SET MARKUP Command	145
8.35.1. Syntax	145
8.35.2. Considerations	145
8.35.3. Examples	146
8.36. SET PARAM Command	151
8.36.1. Syntax	152
8.36.2. Considerations	152
8.36.3. Examples	153
8.37. SET PROMPT Command	154
8.37.1. Syntax	154
8.37.2. Considerations	154
8.37.3. Examples	155
8.38. SET SQLPROMPT Command	156
8.38.1. Syntax	156

8.38.2. Considerations	156
8.38.3. Examples	157
8.39. SET SQLTERMINATOR Command	158
8.39.1. Syntax	158
8.39.2. Considerations	158
8.39.3. Examples	159
8.40. SET STATISTICS Command	160
8.40.1. Syntax	160
8.40.2. Considerations	160
8.40.3. Examples	161
8.41. SET TIME Command	162
8.41.1. Syntax	162
8.41.2. Considerations	162
8.41.3. Examples	163
8.42. SET TIMING Command	164
8.42.1. Syntax	164
8.42.2. Considerations	164
8.42.3. Examples	164
8.43. SHOW ACTIVITYCOUNT Command	165
8.43.1. Syntax	165
8.43.2. Examples	165
8.44. SHOW ALIAS Command	166
8.44.1. Syntax	166
8.44.2. Considerations	166
8.44.3. Examples	167
8.45. SHOW ALIASES Command	168
8.45.1. Syntax	168
8.45.2. Considerations	168
8.45.3. Examples	168
8.46. SHOW CATALOG Command	169
8.46.1. Syntax	169
8.46.2. Considerations	169
8.46.3. Example	169
8.47. SHOW COLSEP Command	170
8.47.1. Syntax	170
8.47.2. Considerations	170
8.47.3. Examples	170
8.48. SHOW ERRORCODE Command	171
8.48.1. Syntax	171
8.48.2. Examples	171
8.49. SHOW FETCHSIZE Command	172
8.49.1. Syntax	172
8.49.2. Considerations	172
8.49.3. Examples	172

8.50. SHOW HISTOPT Command	173
8.50.1. Syntax	173
8.50.2. Considerations	173
8.50.3. Examples	173
8.51. SHOW IDLETIMEOUT Command	174
8.51.1. Syntax	174
8.51.2. Considerations	174
8.51.3. Examples	175
8.52. SHOW LASTERROR Command	176
8.52.1. Syntax	176
8.52.2. Considerations	176
8.52.3. Examples	176
8.53. SHOW LIST_COUNT Command	177
8.53.1. Syntax	177
8.53.2. Considerations	177
8.53.3. Examples	177
8.54. SHOW MARKUP Command	178
8.54.1. Syntax	178
8.54.2. Considerations	178
8.54.3. Examples	178
8.55. SHOW PARAM Command	179
8.55.1. Syntax	179
8.55.2. Considerations	179
8.55.3. Example	179
8.56. SHOW PREPARED Command	180
8.56.1. Syntax	180
8.56.2. Considerations	180
8.56.3. Examples	180
8.57. SHOW RECCOUNT Command	181
8.57.1. Syntax	181
8.57.2. Considerations	181
8.57.3. Examples	181
8.58. SHOW REMOTEPROCESS Command	182
8.58.1. Syntax	182
8.58.2. Considerations	182
8.58.3. Example	182
8.59. SHOW SCHEMA Command	183
8.59.1. Syntax	183
8.59.2. Considerations	183
8.59.3. Example	183
8.60. SHOW SESSION Command	184
8.60.1. Syntax	184
8.60.2. Considerations	184
8.60.3. Examples	186

8.61. SHOW SQLPROMPT Command	187
8.61.1. Syntax	187
8.61.2. Considerations	187
8.61.3. Example	187
8.62. SHOW SQLTERMINATOR Command	188
8.62.1. Syntax	188
8.62.2. Considerations	188
8.62.3. Example	188
8.63. SHOW STATISTICS Command	189
8.63.1. Syntax	189
8.63.2. Considerations	189
8.63.3. Example	189
8.64. SHOW TIME Command	190
8.64.1. Syntax	190
8.64.2. Considerations	190
8.64.3. Example	190
8.65. SHOW TIMING Command	191
8.65.1. Syntax	191
8.65.2. Considerations	191
8.65.3. Example	191
8.66. SPOOL Command	192
8.66.1. Syntax	192
8.66.2. Considerations	193
8.66.3. Examples	193
8.67. VERSION Command	197
8.67.1. Syntax	197
8.67.2. Considerations	197
8.67.3. Example	197

Revision History

Version	Date
2.2.0	TBD
2.1.0	May 1, 2017
2.0.1	July 7, 2016
2.0.0	June 6, 2016
1.3.0	January, 2016

Chapter 1. About This Document

This guide describes how to use the Trafodion Command Interface (trafci) on a client workstation to connect to and query a Trafodion database. The trafci enables you to run SQL statements interactively or from script files.

1.1. Intended Audience

This guide is intended for database administrators and support personnel who are maintaining and monitoring a Trafodion database.

1.2. New and Changed Information

This manual shows updated versions for Trafodion Release 2.3.0.

1.3. Notation Conventions

This list summarizes the notation conventions for syntax presentation in this manual.

- UPPERCASE LETTERS

Uppercase letters indicate keywords and reserved words. Type these items exactly as shown. Items not enclosed in brackets are required.

```
SELECT
```

- lowercase letters

Lowercase letters, regardless of font, indicate variable items that you supply. Items not enclosed in brackets are required.

```
file-name
```

- [] Brackets

Brackets enclose optional syntax items.

```
DATETIME [start-field TO] end-field
```

A group of items enclosed in brackets is a list from which you can choose one item or none.

The items in the list can be arranged either vertically, with aligned brackets on each side of the list, or horizontally, enclosed in a pair of brackets and separated by vertical lines.

For example:

```
DROP SCHEMA schema [CASCADE]
DROP SCHEMA schema [ CASCADE | RESTRICT ]
```

- { } Braces

Braces enclose required syntax items.

```
FROM { grantee [, grantee ] ... }
```

A group of items enclosed in braces is a list from which you are required to choose one item.

The items in the list can be arranged either vertically, with aligned braces on each side of the list, or horizontally, enclosed in a pair of braces and separated by vertical lines.

For example:

```
INTERVAL { start-field TO end-field }
{ single-field }
INTERVAL { start-field TO end-field | single-field }
```

- | Vertical Line

A vertical line separates alternatives in a horizontal list that is enclosed in brackets or braces.

```
{expression | NULL}
```

- ... Ellipsis

An ellipsis immediately following a pair of brackets or braces indicates that you can repeat the enclosed sequence of syntax items any number of times.

```
ATTRIBUTE[S] attribute [, attribute] ...  
{, sql-expression } ...
```

An ellipsis immediately following a single syntax item indicates that you can repeat that syntax item any number of times.

For example:

```
expression-n ...
```

- Punctuation

Parentheses, commas, semicolons, and other symbols not previously described must be typed as shown.

```
DAY (datetime-expression)  
@script-file
```

Quotation marks around a symbol such as a bracket or brace indicate the symbol is a required character that you must type as shown.

For example:

```
"{" module-name [, module-name] ... "}"
```

- Item Spacing

Spaces shown between items are required unless one of the items is a punctuation symbol such as a parenthesis or a comma.

```
DAY (datetime-expression) DAY(datetime-expression)
```

If there is no space between two items, spaces are not permitted. In this example, no spaces are permitted between the period and any other items:

```
myfile.sh
```

- Line Spacing

If the syntax of a command is too long to fit on a single line, each continuation line is indented three spaces and is separated from the preceding line by a blank line.

This spacing distinguishes items in a continuation line from items in a vertical list of selections.

```
match-value [NOT] LIKE _pattern  
    [ESCAPE esc-char-expression]
```

1.4. Comments Encouraged

We encourage your comments concerning this document. We are committed to providing documentation that meets your needs. Send any errors found, suggestions for improvement, or compliments to user@trafodion.incubator.apache.org.

Include the document title and any comment, error found, or suggestion for improvement you have concerning this document.

Chapter 2. Introduction

The Trafodion Command Interface (trafci) is a command-line interface that you download and install on a client workstation that has the Trafodion JDBC Type 4 Driver installed. Operating systems that support the JDBC driver include Windows and Linux. The JDBC driver connects trafci on a client workstation to a Trafodion database.

trafci enables you to perform daily administrative and database management tasks by running SQL statements or other commands interactively or from script files. You can also run trafci from a Perl or Python command line or from Perl or Python programs.

Chapter 3. Install and Configure

3.1. Install trafci

To install trafci on a client workstation, follow the procedures in the [Trafodion Client Installation Guide](#). Ensure that you set up the Java Path per the instructions in that guide.

3.2. Test trafci Launch

1. Launch trafci and verify that you can connect to the database. For instructions, see [Launch trafci](#).

This window should appear:

2. If you cannot launch trafci or connect to the database, verify that:
 - The database platform is available and running, and the port number is correct for the database platform.
 - The Java path is set to the correct location. See [Verify and Set the Java Path](#).
 - You installed the trafci and JDBC software files correctly.

See the [Trafodion Client Installation Guide](#).

Chapter 4. Launch trafci

This chapter describes how to launch trafci from the Window or Linux environment of a client workstation. For information about launching trafci from Perl or Python, see [Run trafci from Perl or Python](#).

Before launching trafci, make sure that you have set the Java path to the correct location. See [Verify and Set Java Path](#).

4.1. Launch trafci on Windows Workstation

1. Find the Windows launch file, `trafci.cmd`, in the `bin` folder:

2. Double-click the `trafci.cmd` file.

trafci appears, prompting you to enter the host name or IP address of the database platform, your user name, and password. See [Log In to Database Platform](#).

4.1.1. Create `trafci.cmd` Shortcut

To enable a user to launch trafci from a shortcut icon on the desktop:

1. Right-click the desktop and select **New>Shortcut**:

2. Type the location of `trafci.cmd` within double quotes (") or click **Browse** to locate that file, and then click **Next**:

For the locations of the installed trafci software files, see the [Trafodion Client Installation Guide](#).

3. Type a name for the shortcut and click **Finish**:

4. If desired, specify optional launch parameters for the shortcut:

a. Right-click the shortcut icon and select **Properties**:

b. Select the **Shortcut** tab.

c. In the **Target** box, insert a space after "...\\Trafodion Command Interface\\bin\\trafci.cmd" and add the optional launch parameters:

For more information, see [Optional Launch Parameters](#).

d. Click **OK**.

5. To launch trafci, double-click the shortcut icon.

trafci appears. If you did not set the optional launch parameters, trafci prompts you to enter the host name or IP address of the database platform, your user name, and password. See [Log In to Database Platform](#).

4.2. Launch trafci on Linux Workstation

In the terminal window, enter:

```
./<trafci-installation-directory>/trafci/bin/trafci.sh
```

<trafci-installation-directory> is the directory where you installed the trafci software files. For more information, see the [Trafodion Client Installation Guide](#).

4.2.1. Set `trafci.sh` PATH

To enable a user to launch trafci anywhere on the client workstation:

1. Open the user profile (`.profile` or `.bash_profile` for the Bash shell) in the `$HOME` directory.

```
cd $HOME  
vi .profile
```

2. In the user profile, set the PATH environment variable to include the path of the `trafci.sh` file.

```
export PATH=/<trafci-installation-directory>/trafci/bin/: ...
```

trafci-installation-directory is the directory where you installed the trafci software files. For more information, see the [Trafodion Client Installation Guide](#). Check that no space is after the colon (:) in the path.

In the C shell, use the `setenv` command instead of `export`.

3. To activate the changes, either log out and log in again or execute the user profile.

```
. .profile
```

4. On the command line, execute the `trafci.sh` file to launch trafci:

```
trafci.sh
```

trafci appears, prompting you to enter the host name or IP address of the database platform, your user name, and password. See [Log In to Database Platform](#).

To enable all users to launch trafci anywhere on the system, create a symbolic link to the `trafci.sh` file in the `/usr/bin` or `/usr/local/bin` directory:

```
ln -s ./<trafci-installation-directory>/trafci/bin/trafci.sh /usr/bin/trafci.sh
```

4.2.2. Preset the Optional Launch Parameters

To preset the optional launch parameters for each session, use an `alias` in the shell command.

```
alias trafci='trafci.sh -h 16.123.456.78:23400 -u user1 -p xxxxxx'
```

You can add the alias, trafci, to the user profile, or you can enter it at a command prompt. For more information about the optional launch parameters, see [Use Optional Launch Parameters](#).

4.3. Log In to Database Platform

4.3.1. Log In Without Login Parameters

If you launch trafci and do not specify login parameters on the command line, follow these steps:

1. After you launch trafci, trafci shows the welcome banner and prompts you to enter the host name or IP address of the database platform:

```
Host Name/IP Address: _
```

Enter a host name:

```
host-name[.domain-name][:port-number]
```

- If you do not specify the domain name, trafci uses the domain of the client workstation.
- If you do not specify a port number, trafci uses the default port number, which is 23400.

Or enter an IP address:

```
IP-address[:port-number]
```

2. Enter your directory-service (or LDAP) user name. User names are case-insensitive.
3. Enter your password. Passwords are case-sensitive.
4. After you finish logging in to the database platform, the SQL prompt appears:

```
Connected to Trafodion  
  
SQL>
```

At the prompt, you can enter an SQL statement or an interface command. For more information, see [Run Interactive Commands in trafci](#).

trafci allows you to reenter the login values, with a maximum of three retries, before it closes the session. For more information, see [Retry Login](#).

4.3.2. Use Login Parameters

To avoid entering a host name, user name, or password each time you launch trafci, use these login parameters:

- -h or -host
- -u or -user
- -p or -password

Example: Windows Login

```
cd <trafci-installation-directory>\Trafodion Command Interface\bin  
trafci.cmd -h 16.123.456.78:23400 -u user1 -p xxxxxxx
```

Example: Linux Login

```
cd <trafci-installation-directory>/trafci/bin  
./trafci.sh -h 16.123.456.78:23400 -u user1 -p xxxxxxx
```

trafci launches and prompts you to enter an SQL statement or an interface command:

```
Welcome to Trafodion Command Interface  
Copyright(C) 2013-2105 Apache Software Foundation  
  
Connected to Trafodion  
  
SQL>
```

For more information about the login parameters, see [Use Optional Launch Parameters](#).

You can include these parameters in a shortcut to the `trafci.cmd` file or in a launch file for the `trafci.sh` file. For more information, see [Create trafci.cmd Shortcut](#) or [Preset the Optional Launch Parameters](#), respectively.

4.4. Retry Login

trafci allows you to reenter the login values, with a maximum of three retries, before it closes the session.

trafci applies the retry logic as follows:

- If you specify an invalid host name, trafci prompts you to reenter the host name.

Example

```
$ trafci -h dd # dd is invalid

Welcome to Trafodion Command Interface
Copyright(C) 2013-2105 Apache Software

Unknown Host: dd

Host Name/IP Address: 172.16.1.1

User Name: user1
Password:

Connected to Trafodion SQL>
```

- If you specify an invalid user name or password, trafci prompts you to reenter the user name and password.

If you specify an invalid password, trafci prompts only for your user name and password. After three unsuccessful retries, the session is terminated:

Example

```
$ trafci -h 172.16.1.1 -u user1 -p x

Welcome to Trafodion Command Interface
Copyright(C) 2013-2105 Apache Software

**** ERROR[8837] CLI Authentication : User: user1 : invalid username or password
[2105-03-12 16:23:44]

User Name: user1
Password:

**** ERROR[8837] CLI Authentication : User: user1 : invalid username or password
[2105-03-12 16:25:28]

User Name: user1
Password:

**** ERROR[8837] CLI Authentication : User: user1 : invalid username or password
[2105-03-12 16:26:36]

Press any key to close this session
```

- If all the login parameters that you specify are invalid, trafci prompts you to enter the host name. When you enter a valid host name or IP address, trafci prompts you to enter a user name and password.
- The retry logic applies to the CONNECT and RECONNECT commands. For the RECONNECT command, the retry logic applies only when no prior connection has been established (`-noconnect`).

For example, if you specify the CONNECT command with a valid user name and host name, then trafci prompts for the user name and password only.

```
SQL> connect user1/xxx@172.16.1.1

com.hp.jdbc.HPT4Exception: **** ERROR[8837] CLI Authentication : User: user1 :
invalid username or password [2105-03-12 16:35:15]

User Name: user1
Password: abc

Connected to Trafodion SQL>
```

- trafci does not prompt you to reenter the login values in these cases:
- When you include the `-q` or `-version` parameter on the command line. (The `-s` parameter permits login retries.)
 - For a session started using redirected or piped input.

In these cases, trafci returns an error message and closes the session. You must re-launch the trafci session to connect to the Trafodion database.

4.5. Optional Launch Parameters

To customize how you launch and log in to trafci, use the optional parameters described in the table below on the command line:

```
trafci{.sh | .cmd} [optional-parameter]...
```

- *optional-parameter*

is one of the launch or login parameters. For details, see the following table.

Launch or Login Parameter	Description
<code>{-h -host} host-name[:port-number]</code> <code>{-h -host} IP-address[:port-number]</code>	<p>Specifies the host name or IP address of the database platform to which you want the client to connect. The <i>host-name</i> should include the domain name of the database platform if it is different from the domain of the client workstation. If you do not specify a port number, trafci uses the default port number, which is 23400.</p> <p>See Use Login Parameters.</p>
<code>{-u -user} username</code>	<p>Specifies the user name for logging in to the database platform. The <i>username</i> is case-insensitive.</p> <p>For an example, see Use Login Parameters.</p>
<code>{-r -role} role-name</code>	<p>Reserved for future use.</p>
<code>{-p -password} password</code>	<p>Specifies the password of the user for logging in to the database platform. <i>password</i> is case-sensitive.</p> <p>For an example, see Use Login Parameters.</p>
<code>{-q -sql} "command"</code>	<p>Specifies that an SQL statement or an interface command be run when launching trafci. You cannot specify this parameter at the same time as the -s or -script parameter.</p> <p>For more information, see Run Command When Launching trafci.</p>
<code>{-s -script} script-file-name</code>	<p>Specifies that a script file be run when launching trafci in interactive mode. You cannot specify this parameter at the same time as the -q or -sql parameter.</p> <p>For more information, see Run Script When Launching trafci.</p>
<code>-noconnect</code>	<p>Launches an trafci session without connecting to the database.</p> <p>For more information, see Launch trafci Without Connecting to the Database.</p>

Launch or Login Parameter	Description
-version	<p>Displays the build version of trafci and the Trafodion JDBC Type 4 Driver. Upon completion of the display, the client exits.</p> <p>If any other parameters are included with the -version parameter, they are ignored.</p> <p>For more information, see Run trafci With -version.</p>
-help	<p>Displays a list of accepted arguments with descriptions and then exits.</p> <p>For more information, see Run trafci With -version.</p>

4.6. Run Command When Launching trafci

To execute an SQL statement or an interface command when launching trafci, use the `-q` or `-sql` command-line parameter. This parameter enables you to run a single command on the command line without having to enter commands in trafci.

You cannot specify this parameter at the same time as the `-s` or `-script` parameter.

When using `-q` or `-sql`, you must enclose the command in double quotes (`"`). The SQL terminator is not required at the end of an SQL statement and is disallowed after an interface command.

Although you can run any of the interface commands with `-q` or `-sql`, the `@`, `OBEY`, and `PRUN` commands are the most useful.

Example

Use `-q` or `-sql` with the `CREATE SCHEMA` statement to create a schema when launching trafci:

- On Windows, in the **Command Prompt** window, enter:

```
cd _trafci-installation-directory_\Trafodion Command Interface\bin
trafci.cmd -q "create schema persnl"
```

- On Linux or UNIX, in the terminal window, enter:

```
cd _trafci-installation-directory_/trafci/bin
./trafci.sh -q "create schema persnl"
```

After you enter the SQL statement, trafci launches and prompts you to log in by default (if you did not specify `-h`, `-u`, and `-p` on the command line), runs the SQL statement, and then returns to the command prompt:

```
Host Name/IP Address: 16.123.456.78:23400 User Name: user1

Password:

--- SQL operation complete.

C:\Program Files (x86)\Apache Software Foundation\Trafodion Command Interface\bin>
```

Example

Use `-q` or `-sql` with the `PRUN` command to run multiple script files simultaneously from the command line:

- On Windows, in the **Command Prompt** window, enter:

```
cd <trafci-installation-directory>\Trafodion Command Interface\bin
trafci.cmd -q "prun"
```

- On Linux, in the terminal window, enter:

```
cd <trafci-installation-directory>/trafci/bin
./trafci.sh -q "prun"
```

After you enter the interface command, trafci launches and prompts you to log in by default (if you did not specify `-h`, `-u`, and `-p` on the command line), and runs the command. The parallel run (`PRUN`) operation prompts you to enter settings and then executes the script files. At the end of the `PRUN` operation, trafci returns to the command prompt.

For more information about the `PRUN` operation, see [PRUN Command](#).

4.7. Run Script When Launching trafci

To run a script file when launching trafci, use the `-s` or `-script` command-line parameter.

You cannot specify this parameter at the same time as the `-q` or `-sql` parameter.

After you launch trafci with `-s` or `-script`, trafci executes the script file in interactive mode. trafci remains open until you enter the `EXIT`, `QUIT`, or `DISCONNECT` command. To quit the interface immediately after executing a script file, include the `EXIT`, `QUIT`, or `DISCONNECT` command at the end of the script file.

Example

You can create a script file that contains `SET` commands that customize a session when you launch trafci:

For more information, [Create a Script File](#).

Example

- On Windows, in the **Command Prompt** window, enter:

```
cd <trafci-installation-directory>\Trafodion Command Interface\bin
trafci.cmd -s settings.txt
```

Specify the full path of the script file if it is outside the directory of `trafci.cmd`.

- On Linux, in the terminal window, enter:

```
cd <trafci-installation-directory>/trafci/bin +
./trafci.sh -s settings.txt
```

Specify the full path of the script file if it is outside the directory of `trafci.sh`.

trafci launches and prompts you to log in by default (if you did not specify `-h`, `-u`, and `-p` on the command line), and runs the commands in the script file:

```
Welcome to Trafodion Command Interface
Copyright(C) 2013-2105 Apache Software Foundation

Host Name/IP Address: 16.123.456.78:23400 User Name: user1
Password:
Connected to Trafodion

SQL>SET IDLETIMEOUT 0

SQL>SET SQLPROMPT *

*SET TIME ON

14:14:57 *SET TIMING ON

2:14:57 PM *SET SQLTERMINATOR .
```

4.8. Launch trafci Without Connecting to the Database

To start trafci without connecting to a Trafodion database, use the `-noconnect` option. See [DISCONNECT command](#) for a list of interface commands that can be run without a connection.

Example

- On Windows, in the **Command Prompt** window, enter:

```
cd <trafci-installation-directory>\Trafodion Command Interface\bin
trafci.cmd -noconnect
```

- On Linux, in the terminal window, enter:

```
cd <trafci-installation-directory>/trafci/bin
./trafci.sh -noconnect
```

4.9. Run trafci With `-version`

To display the build version of trafci and the Trafodion JDBC Type 4 Driver, use the `-version` option. If other parameters are included with the `-version` parameter, they are ignored.

Example

- On Windows, in the **Command Prompt** window, enter:

```
cd <trafci-installation-directory>\Trafodion Command Interface\bin
trafci.cmd -version
```

- On Linux, in the terminal window, enter:

```
cd <trafci-installation-directory>/trafci/bin
./trafci.sh -version
```

```
Welcome to Trafodion Command Interface
Copyright(C) 2013-2105 Apache Software Foundation
```

```
Trafodion JDBC Type 4 Driver : Traf_JDBC_Type4_Build_40646 Trafodion
Command Interface : trafci_Build_40646
```

4.10. Run trafci With -help

To display a list of acceptable list of parameters, including proper usage information, use the `-help` option. After displaying this information the application exits.

Example

- On Windows, in the **Command Prompt** window, enter:

```
cd <trafci-installation-directory>\Trafodion Command Interface\bin
trafci -help
```

- On Linux, in the terminal window, enter:

```
cd <trafci-installation-directory>/trafci/bin
./trafci.sh -help
```

4.11. Exit trafci

To exit trafci, enter one of these commands at a prompt:

- EXIT
- QUIT

Example

```
SQL> QUIT
```

These commands are not case-sensitive and do not require a terminator before you press **Enter**. After you enter one of these commands, trafci immediately quits running and disappears from the screen.

Chapter 5. Run Commands Interactively

After launching `trafci`, you can run SQL statements and interface commands in the command-line interface.

5.1. User Interface

5.1.1. Product Banner

After you launch `trafci` and connect to the database platform, the product banner appears in the command-line interface:

A screenshot of a Windows-style application window titled "Trafodion Command Interface". The window has a standard title bar with minimize, maximize, and close buttons. The main content area is a black terminal window with white text. The text displayed is: "Welcome to Apache Trafodion Command Interface", "Copyright (c) 2015 Apache Software Foundation", "Connected to Trafodion", and "SQL>". The "SQL>" prompt is on the same line as "Connected to Trafodion". There is a vertical scrollbar on the right side of the terminal window.

```
Welcome to Apache Trafodion Command Interface
Copyright (c) 2015 Apache Software Foundation

Connected to Trafodion
SQL>
```

5.1.2. Interface Prompt

The standard prompt is `SQL>`. You can change the prompt, `SQL>`, to something else by using the `SET SQLPROMPT` or `SET PROMPT` command. For more information, [Customize the Standard Prompt](#).

5.1.3. Break the Command Line

You cannot break an interface command over multiple lines. Each interface command must be entered on one line. If you accidentally break an interface command across more than one line, enter the SQL terminator and then reenter the command on one line.

You can continue any SQL statement over multiple lines, breaking that statement at any point except within a word, a numeric literal, or a multi-character operator (for example, <=). To break a string literal in a DML statement, use a concatenation operator (||). For more information, see the concatenation operator in the [Trafodion SQL Reference Manual](#).

To terminate an SQL statement that spans multiple lines, use the SQL terminator for the session. You can also include several SQL statements on the same command line provided that each one is terminated by the SQL terminator. For more information, see [Set and Show the SQL Terminator](#).

5.1.4. Case Sensitivity

In the command-line interface, you can enter SQL statements and interface commands in uppercase, lowercase, or mixed-case characters. All parts of statements and commands are case-insensitive except for parts that you enclose in single-quotes (') or double-quotes (").

5.2. Interface Commands

The interface commands allow you to customize trafci (for example, by using `SET` commands) or return information about the interface settings or database objects (for example, by using `SHOW` commands).

For more information about the interface commands, see [Commands](#).

Each interface command must be entered on one line. If you accidentally break an interface command across more than one line, enter the SQL terminator and then reenter the command on one line.

5.2.1. Show Session Attributes

To display the attributes and settings of the current trafci session, use the `ENV`, `SHOW SESSION`, or `SESSION` command.

Example

This `SESSION` command displays the session attributes:

```
SQL> SESSION

COLSEP           " "
HISTOPT          DEFAULT [No expansion of script files]
IDLETIMEOUT      0 min(s) [Never Expires]
LIST_COUNT       0 [All Rows]
LOG_FILE         c:\session.txt
LOG_OPTIONS      APPEND,CMDTEXT ON
MARKUP           RAW
PROMPT           SQL>
SCHEMA           SEABASE
SERVER           sqws135.houston.host.com:23400
SQLTERMINATOR    ;
STATISTICS       OFF
TIME             OFF
TIMING           OFF
USER             user1

SQL>
```

For more information, see [ENV Command SHOW SESSION Command](#).

5.2.2. Set and Show Session Idle Timeout Value

The idle timeout value of a session determines when the session expires after a period of inactivity. To set the idle timeout value of a session, enter the `SET IDLETIMEOUT` command.

Example

This `SET IDLETIMEOUT 0` command sets the idle timeout to an infinite amount of time so that the session never expires:

```
SQL> SET IDLETIMEOUT 0
SQL>
```

To show the idle timeout value that is in effect for the session, enter the `SHOW IDLETIMEOUT` command.

Example

This `SHOW IDLETIMEOUT` command displays an idle timeout of zero minutes, which means that the session never expires:

```
SQL> SHOW IDLETIMEOUT

IDLETIMEOUT 0 min(s) [Never Expires]

SQL>
```

For more information, see the [SET IDLETIMEOUT Command](#) and the `<<cmd_show_idletimeout, SET IDLETIMEOUT Command>`.

5.2.3. Customize the Standard Prompt

To change the standard prompt in the command-line interface, use one or both of these commands:

SET PROMPT Command

The `SET PROMPT` command changes the default prompt to a specified character or string.

Example

This `SET PROMPT` command changes the prompt to the current user (`user1`) and `ENTER>`:

```
SQL>set prompt "%USER ENTER>"  
  
user1 ENTER>
```

For more information, see [SET PROMPT Command](#).

SET TIME Command

The `SET TIME ON` command causes the current time of the client workstation to be displayed in the prompt:

```
SQL ENTER> SET TIME ON  
  
20:32:26 SQL ENTER>
```

The `SET TIME OFF` command removes the current time from the prompt:

```
20:32:26 SQL ENTER> SET TIME OFF  
  
SQL ENTER>
```

For more information, see the [SET TIME Command](#).

5.2.4. Set and Show the SQL Terminator

The SQL terminator symbolizes the end of an SQL statement. By default, the SQL terminator is a semicolon (;).

To change the SQL terminator, enter the `SET SQLTERMINATOR` command.

Example

This `SET SQLTERMINATOR` command sets the SQL terminator to a period (.):

```
SQL> SET SQLTERMINATOR .
SQL> INSERT INTO sales.custlist
+> (SELECT * FROM invent.supplier
+> WHERE suppnun=8).

--- 1 row(s) inserted.
SQL>
```

To show the SQL terminator that is in effect for the session, enter the `SHOW SQLTERMINATOR` command.

Example

This `SHOW SQLTERMINATOR` command displays `SQLTERMINATOR .`, where the period (.) is the SQL terminator for the session:

```
SQL> SHOW SQLTERMINATOR
SQLTERMINATOR .

SQL>
```

For more information, see the [SET SQLTERMINATOR Command](#) and the [SHOW SQLTERMINATOR Command](#).

5.2.5. Display the Elapsed Time

By default, trafci does not display the elapsed time of an SQL statement after the statement executes. To display the elapsed time after each SQL statement executes, enter the `SET TIMING ON` command:

```
SQL> SET TIMING ON
SQL> SELECT suppname, street, city, state, postcode
+> FROM invent.supplier
+> WHERE suppnun=3;
```

SUPPNAME	STREET	CITY	STATE	POSTCODE
HIGH DENSITY INC	7600 EMERSON	NEW YORK	NEW YORK	10230

```
--- 1 row(s) selected. Elapsed :00:00:00.111 SQL>
```

To prevent the elapsed time from being displayed after each SQL statement executes, enter the `SET TIMING OFF` command:

```
SQL> SET TIMING OFF
SQL> /
```

SUPPNAME	STREET	CITY	STATE	POSTCODE
HIGH DENSITY INC	7600 EMERSON	NEW YORK	NEW YORK	10230

```
--- 1 row(s) selected.

SQL>
```

For more information, see the [SET TIMING Command](#).

5.2.6. Set and Show the Current Schema

By default, the schema of the session is `USR`. The SQL statement, `SET SCHEMA`, allows you to set the schema for the `trafci` session.

Example

This `SET SCHEMA` statement changes the default schema to `PERSNL` for the session:

```
SQL> SET SCHEMA persnl;

--- SQL operation complete.

SQL> DELETE FROM employee
+> WHERE first_name='TIM' AND
+> last_name='WALKER';

--- 1 row(s) deleted.

SQL>
```

The schema that you specify with `SET SCHEMA` remains in effect until the end of the session or until you execute another `SET SCHEMA` statement.

If you execute this statement in a script file, it affects not only the SQL statements in the script file but all subsequent SQL statements that are run in the current session. If you set the schema in a script file, reset the default schema for the session at the end of the script file.

For more information about the `SET SCHEMA` statement, see the [Trafodion SQL Reference Manual](#).

The `SHOW SCHEMA` command displays the current schema for the session.

Example

This `SHOW SCHEMA` command displays `SCHEMA PERSNL`, where `PERSNL` is the name of the current schema for the session:

```
SQL> SHOW SCHEMA SCHEMA persnl
SQL>
```

For more information, [SHOW SCHEMA Command](#).

5.2.7. Limit Query Result Set

To set the maximum number of rows to be returned by `SELECT` statements that are executed in the session, enter the `SET LIST_COUNT` command.

Example

This `SET LIST_COUNT` command limits the result set of queries to 20 rows:

```
SQL> SET LIST_COUNT 20
```

To show the limit that is in effect for the session, enter the `SHOW LIST_COUNT` command.

Example

This `SHOW LIST_COUNT` command shows that the number of rows returned by `SELECT` statements is unlimited:

```
SQL> SHOW LIST_COUNT

LISTCOUNT 0 [All Rows]
```

For more information, see the [SET LIST_COUNT Command](#) and [SHOW LIST_COUNT Command](#).

5.2.8. Display Executed Commands

To display commands that were recently executed in the `trafci` session, enter the `HISTORY` command. The `HISTORY` command associates each command with a number that you can use to re-execute or edit the command with the `FC` command. See [Edit and Reexecute a Command](#).

Example

This `HISTORY` command displays a maximum of 100 commands that were entered in the session:

```
SQL> HISTORY

1> SET IDLETIMEOUT 0
2> SET SCHEMA persnl;
3> SELECT * FROM project;

SQL>
```

To save the session history in a user-specified file, enter the `SAVEHIST` command.

Example

This `SAVEHIST` command saves the session history in a file named `history.txt` in the local directory where you are running `trafci`:

```
SQL> SAVEHIST history.txt
```

For more information, see the [HISTORY Command](#) and the [SAVEHIST Command](#).

5.2.9. Edit and Reexecute a Command

To edit and reexecute a command in the history buffer of an `trafci` session, enter the `FC` command. To display the commands in the history buffer, use the `HISTORY` command. See [Display Executed Commands](#).

Example

This **FC** command and its delete (`D`) editing command correct a `SELECT` statement that was entered incorrectly:

```
SQL> FC

SQL> SELECCT FROM employee;
.... d
SQL> SELECT FROM employee;
```

Pressing Enter executes the corrected `SELECT` statement. For more information, see the [FC Command](#).

5.2.10. Clear the Interface Window

After entering commands in trafci, you can clear the interface window by using the `CLEAR` command.

Example

This `CLEAR` command clears the interface window so that only the prompt appears at the top of the window:

```
SQL> CLEAR
```

For more information, see the [CLEAR Command](#).

5.2.11. Obtain Help

To display help text for an interface command that is supported in trafci, enter the `HELP` command.

Example

This `HELP` command displays syntax and examples of the `FC` command:

```
SQL> HELP FC
```

For more information, see the [HELP Command](#).

5.3. Run SQL Statements

In trafci, you can run SQL statements interactively. trafci supports all the SQL statements, SQL utilities, and other SQL-related commands that the Trafodion database engine supports. For more information about those SQL statements, see the *Trafodion SQL Reference Manual*.

To run SQL statements from script files in trafci, see [Run Scripts](#).

5.3.1. Execute an SQL Statement

Example

You can query the `EMPLOYEE` table and return an employee's salary by executing this `SELECT` statement in trafci:

```
SQL> SELECT salary
+> FROM persnl.employee
+> WHERE jobcode=100;

SALARY
-----
175500.00
137000.10
139400.00
138000.40
 75000.00
 90000.00
118000.00
 80000.00
 70000.00
 90000.00
 56000.00

--- 11 row(s) selected.

SQL>
```

If the SQL statement executes successfully, trafci returns a message indicating that the SQL operation was successful, followed by the standard prompt. If a problem occurs during the execution of the SQL statement, trafci returns an error message.

5.3.2. Repeat an SQL Statement

To run a previously executed SQL statement, use the `/`, `RUN`, or `REPEAT` command.

```
SQL> /

SALARY
-----
175500.00
137000.10
139400.00
138000.40
 75000.00
 90000.00
118000.00
 80000.00
 70000.00
 90000.00
 56000.00

--- 11 row(s) selected.

SQL>
```

For more information, see the [/ Command](#), [RUN Command](#), or [REPEAT Command](#).

5.3.3. Prepare and Execute SQL Statements

You can prepare, or compile, an SQL statement by using the `PREPARE` statement and later execute the prepared SQL statement by using the `EXECUTE` statement.

Prepare a SQL Statement

Use the `PREPARE` statement to compile an SQL statement for later execution with the `EXECUTE` statement. You can also use the `PREPARE` statement to check the syntax of an SQL statement without executing the statement.

Example

This `PREPARE` statement compiles a `SELECT` statement named `empsal` and detects a syntax error:

```
SQL> PREPARE empsal FROM
+> SELECT salary FROM employee
+> WHERE jobcode = 100;
SQL>
```

You can then correct the syntax of the SQL statement and prepare it again:

```
SQL> PREPARE empsal FROM
+> SELECT salary FROM persnl.employee
+> WHERE jobcode = 100;

--- SQL command prepared.
```

To specify a parameter to be supplied later, either in a `SET PARAM` statement or in the `USING` clause of an `EXECUTE` statement, use one of these types of parameters in the SQL statement:

- Named parameter, which is represented by `?param-name`
- Unnamed parameter, which is represented by a question mark (?) character

Example

This prepared `SELECT` statement specifies unnamed parameters for salary and job code:

```
SQL> PREPARE findemp FROM
+> SELECT FROM persnl.employee
+> WHERE salary > ? AND jobcode = ?;

--- SQL command prepared.
```

This `PREPARE` statement prepares another `SELECT` statement named `empcom`, which has one named parameter, `?dn`, for the department number, which appears twice in the statement:

```
SQL> PREPARE empcom FROM
+> SELECT first_name, last_name, deptnum
+> FROM persnl.employee
+> WHERE deptnum <> ?dn AND salary <=
+> (SELECT AVG(salary)
+> FROM persnl.employee
+> where deptnum = ?dn);

--- SQL command prepared.
```

For the syntax of the `PREPARE` statement, see the [Trafodion SQL Reference Manual](#).

Setting Parameters

In an `trafci` session, you can set a parameter of an SQL statement (either prepared or not) by using the `SET PARAM` command.

The parameter name is case-sensitive. If you specify it in lowercase in the `SET PARAM` command, you must specify it in lowercase in other statements, such as DML statements or `EXECUTE`.

Example

This `SET PARAM` command sets a value for the parameter named `?sal`, which you can apply to one of the unnamed parameters in the prepared findemp statement or to a named parameter with an identical name in an SQL statement:

```
SQL> SET PARAM ?sal 40000.00
```

This `SELECT` statement uses `sal` as a named parameter:

```
SQL> SELECT last_name  
+> FROM persnl.employee  
+> WHERE salary = ?sal;
```

This `SET PARAM` command sets a value for the parameter named `dn`, which you can apply to the named parameter, `?dn`, in the prepared `empcom` statement or to a named parameter with an identical name in an SQL statement:

```
SQL> SET PARAM ?dn 1500
```

For the syntax of the `SET PARAM` command, see the [SET PARAM Command](#).

To determine what parameters you have set in the current session, use the `SHOW PARAM` command.

Example

This `SHOW PARAM` command displays the recent `SET PARAM` settings:

```
SQL> SHOW PARAM dn 1500  
sal 40000.00  
SQL>
```

For the syntax of the `SHOW PARAM` command, [SHOW PARAM Command](#).

Reset the Parameters

To change the value of a parameter, specify the name of the parameter in the RESET PARAM command and then use the SET PARAM command to change the setting.

Example

Suppose that you want to change the salary parameter to 80000.00:

```
SQL> RESET PARAM ?sal
SQL> SET PARAM ?sal 80000.00
SQL>
```

Entering the RESET PARAM command without specifying a parameter name clears all parameter settings in the session.

Example

```
SQL> RESET PARAM
SQL> SHOW PARAM
SQL>
```

To use the parameters that you had set before, you must reenter them in the session:

```
SQL> SET PARAM ?dn 1500
SQL> SET PARAM ?sal 80000.00
SQL> SHOW PARAM dn 1500

sal 80000.00

SQL>
```

For the syntax of the RESET PARAM command, see the [RESET PARAM Command](#).

5.3.4. Execute a Prepared SQL Statement

To execute a prepared SQL statement, use the `EXECUTE` statement.

Example

This `EXECUTE` statement executes the prepared `empsal` statement, which does not have any parameters:

```
SQL> EXECUTE empsal;

SALARY
-----
137000.10
 90000.00
 75000.00
138000.40
 56000.00
136000.00
 80000.00
 70000.00
175500.00
 90000.00
118000.00

--- 11 row(s) selected.

SQL>
```

This `EXECUTE` statement executes the prepared `empcom` statement, which has one named parameter, `?dn`, which was set by `SET PARAM` for the department number:

```
SQL>EXECUTE empcom;
```

FIRST_NAME	LAST_NAME	DEPTNUM
-----	-----	-----
ALAN	TERRY	3000
DAVID	TERRY	2000
PETE	WELLINGTON	3100
JOHN	CHOU	3500
MANFRED	CONRAD	4000
DINAH	CLARK	9000
DAVE	FISHER	3200
GEORGE	FRENCHMAN	4000
KARL	HELMSTED	4000
JOHN	JONES	4000
JOHN	HUGHES	3200
WALTER	LANCASTER	4000
MARLENE	BONNY	4000
BILL	WINN	2000
MIRIAM	KING	2500
GINNY	FOSTER	3300

MARIA	JOSEF	4000
HERB	ALBERT	3300
RICHARD	BARTON	1000
XAVIER	SEDLMEYER	3300
DONALD	TAYLOR	3100
LARRY	CLARK	1000
JIM	HERMAN	3000
GEORGE	STRICKER	3100
OTTO	SCHNABL	3200
TIM	WALKER	3000
TED	MCDONALD	2000
PETER	SMITH	3300
MARK	FOLEY	4000
HEIDI	WEIGL	3200
ROCKY	LEWIS	2000
SUE	CRAMER	1000
MARTIN	SCHAEFFER	3200
HERBERT	KARAJAN	3200
JESSICA	CRINER	3500

--- 35 row(s) selected.

SQL>

This `EXECUTE` statement executes the prepared `findemp` statement, which has two unnamed parameters: `?sal`, which was set by `SET PARAM` for the salary, and a parameter that was not set in advance for the job code:

```
SQL> EXECUTE findemp USING ?sal, 100;
```

EMP_NUM	FIRST_NAME	LAST_NAME	DEPTNUM	JOBCODE	SALARY
213	ROBERT	WHITE	1500	100	90000.00
23	JERRY	HOWARD	1000	100	137000.10
1	ROGER	GREEN	9000	100	175500.00
29	JANE	RAYMOND	3000	100	136000.00
32	THOMAS	RUDLOFF	2000	100	138000.40
43	PAUL	WINTER	3100	100	90000.00
65	RACHEL	MCKAY	4000	100	118000.00

```
--- 7 row(s) selected.
```

```
SQL>
```

For the syntax of the `EXECUTE` statement, see the [Trafodion SQL Reference Manual](#).

5.4. Log Output

To log an `trafci` session, use the `SPOOL` or `LOG` command. The `SPOOL` and `LOG` commands record into a log file the commands that you enter in the command-line interface and the output of those commands.

5.4.1. Start the Logging Process

To start logging, enter one of these commands:

- `SPOOL ON` or `LOG ON`
- `SPOOL log-file` or `LOG log-file`

For more information, see the [LOG Command](#) and the [SPOOL Command](#).

SPOOL ON or LOG ON Command

The SPOOL ON or LOG ON command logs information about a session in the `sqlspool.lst` file, which trafci stores in the `bin` directory:

- On Windows:

```
<trafci-installation-directory>\Trafodion Command Interface\bin\sqlspool.lst
```

trafci-installation-directory is the directory where you installed the trafci software files.

- On Linux:

```
<trafci-installation-directory>/trafci/bin/sqlspool.lst
```

trafci-installation-directory is the directory where you installed the trafci software files.

Example

This SPOOL ON command starts logging the session in the `sqlspool.lst` file:

```
SQL> SPOOL ON
```

5.4.2. SPOOL log-file or LOG log-file Command

The SPOOL *log-file* and LOG *log-file* commands record information about a session in a log file that you specify. If you specify a directory for the log file, the directory must exist as specified. Otherwise, an error occurs when you try to run the SPOOL or LOG command. If you do not specify a directory for the log file, trafci uses the `bin` directory.

Example

This SPOOL *log-file* command starts logging the session in the `persnl_updates.log` file in the `C:\log` directory:

```
SQL> SPOOL C:\log\persnl_updates.log
```

Using the `CLEAR` Option

The `CLEAR` option clears the contents of an existing log file before logging new information to the file. If you omit `CLEAR`, `trafc` appends new information to existing information in the log file.

Example

This `SPOOL log-file CLEAR` command clears existing information from the specified log file and starts logging the session in the log file:

```
SQL> SPOOL C:\log\persnl_updates.log clear
```

Log Concurrent the `trafc` Sessions

If you plan to run two or more `trafc` sessions concurrently on the same workstation, use the `SPOOL log-file` or `LOG log-file` command and specify a unique name for each log file. Otherwise, each session writes information to the same log file, making it difficult to determine which information belongs to each session.

5.4.3. Stopping the Logging Process

To stop logging, enter one of these commands:

- `SPOOL OFF`
- `LOG OFF`

Example

This `SPOOL OFF` command stops logging in an `trafc` session:

```
SQL> SPOOL OFF
```

5.4.4. View the Contents of a Log File

The log file is an ASCII text file that contains all the lines in `trafci` from the time you start logging to the time you stop logging. The logged lines include prompts, entered commands, output from commands, and diagnostic messages.

Example

This log file contains information from when you started logging to when you stopped logging:

```
=====
Spooling started at May 29, 2105 4:52:23 PM
=====

SQL> SET TRANSACTION ISOLATION LEVEL SERIALIZABLE;

--- SQL operation complete. SQL>begin work;

--- SQL operation complete.

SQL> DELETE FROM employee WHERE empnum=32;

-- 1 row(s) deleted.

SQL> INSERT INTO employee
(empnum, first_name, last_name, deptnum, salary) values(51, 'JERRY',
'HOWARD', 1000, 137000.00);

-- 1 row(s) inserted.

SQL> UPDATE dept SET manager=50
where deptnum=1000;

--- 1 row(s) updated.

SQL> COMMIT WORK;

--- SQL operation complete.

SQL> LOG OFF
```

Chapter 6. Run Scripts

6.1. Create a Script File

A script file that you run in trafci must be an ASCII text file that contains only these elements:

- [SQL Statements](#)
- [Commands](#)
- [Comments](#)
- [Section Headers](#)

For an example, see <script_example, Example Script File>>.

You cannot use shell commands in a script file that you run in trafci. To create shell scripts that run trafci, see [Run trafci from Perl or Python](#).

6.2. SQL Statements

Script files support any of the various SQL statements that you can run in trafci. For more information about SQL statements, see the [Trafodion SQL Reference Manual](#).

6.3. Commands

Most interface commands are supported in script files except the FC command. For a list of the interface commands, see [Commands](#).

6.4. Comments

You can include comments anywhere in a script file. SQL also supports comments. Comments are useful for documenting the functionality of the script file and for debugging. When debugging, use comments to disable specific statements or commands without removing them from the script file.

To denote a comment in a script file, use two hyphens before the comment:

```
-- comment
```

The end of the line marks the end of the comment.

6.5. Section Headers

To create sections of commands within a script file, put a section header at the beginning of each section:

```
?SECTION section-name
```

The *section-name* cannot begin with a number or an underscore. Each section name in a script file should be unique because trafci executes the first section that it finds that matches the section name in the @ or OBEY command. For more information, see the [@ Command OBEY Command](#).

6.6. Example Script File

This script file creates tables in the inventory schema:

```

sch_invent.sql - Notepad
File Edit Format Help

-- CREATE TABLES/VIEWS in SCHEMA INVENT
SET SCHEMA INVENT;
CREATE TABLE INVENT.supplier (
    suppnnum          NUMERIC (4) UNSIGNED
                     NO DEFAULT
                     NOT NULL
    ,suppname         CHARACTER (18)
                     NO DEFAULT
                     NOT NULL
    ,street            CHARACTER (22)
                     NO DEFAULT
                     NOT NULL
    ,city              CHARACTER (14)
                     NO DEFAULT
                     NOT NULL
    ,state             CHARACTER (12)
                     NO DEFAULT
                     NOT NULL
    ,postcode          CHARACTER (10)
                     NO DEFAULT
                     NOT NULL
    ,PRIMARY KEY      (suppnnum)
);
  
```

6.7. Run a Script File

To run a script file in trafci, use the @ or OBEY command. The @ and OBEY commands run one script file at a time in trafci.

To run a script file when launching trafci, see [Run Script When Launching trafci](#).

Example

This @ command runs a script file, `sch_invent.sql`, that creates tables in the inventory schema:

```
@C:\ddl_scripts\sch_invent.sql
```

If the script file is outside the directory of the `trafci.cmd` or `trafci.sh` file (by default, the `bin` directory), you must specify the full path of the script file in the `@` or `OBEY` command.

```
SQL>@C:\ddl_scripts\sch_invent.sql
SQL>-- CREATE SCHEMA
SQL>CREATE SCHEMA INVENT;

--- SQL operation complete.

SQL>-- CREATE TABLES/VIEWS in SCHEMA INVENT
SQL> SET SCHEMA INVENT;

--- SQL operation complete.

SQL>CREATE TABLE INVENT.supplier (
+> suppnum NUMERIC (4) UNSIGNED
+> NO DEFAULT
+> NOT NULL
+> ,suppname CHARACTER (18)
+> NO DEFAULT
+> NOT NULL
+> ,street CHARACTER (22)
+> NO DEFAULT
+> NOT NULL
+> ,city CHARACTER (14)
+> NO DEFAULT
+> NOT NULL
+> ,state CHARACTER (12)
+> NO DEFAULT
+> NOT NULL
+> ,postcode CHARACTER (10)
+> NO DEFAULT
+> NOT NULL
+> ,PRIMARY KEY (suppnum)
+> );

--- SQL operation complete.
```

For more information about the `@` and `OBEY` commands, see the [@ Command](#) and the [OBEY Command](#).

6.8. Log Output

To log output of an `trafci` session while running one script file at a time, use the `SPOOL` or `LOG` command. When you run an `OBEY` or `@` command, `trafci` displays each command in the script file, the output for each command, and diagnostic messages in `trafci`. The `SPOOL` or `LOG` command captures this output as it appears in `trafci` and logs it in a log file.

For more information, [Log Output](#).

6.9. Run Scripts in Parallel

In `trafci`, the `@` and `OBEY` commands allow you to run only one script file at a time. However, the `PRUN` command allows you to run multiple script files simultaneously.

The `PRUN` command is most useful for running sets of data definition language (DDL) statements simultaneously, which speeds up the process of creating large databases. Put all dependent or related DDL statements in the same script file. For more information on running scripts in parallel using the `PRUN` command, see the [PRUN Command](#).

Chapter 7. Run trafci From Perl or Python

You can execute SQL statements in Perl or Python by invoking the trafci Perl or Python wrapper script.

These instructions assume that you installed the trafci product. For more information, see [Install and Configure](#).

7.1. Set the Login Environment Variables

Before launching trafci from Perl or Python, set these login environment variables:

Environment Variable	Description
TRAFCI_PERL_JSERVER=<JavaServer_jar_path>	Specifies the Perl JavaServer JAR location.
TRAFCI_PYTHON_JSERVER=<Jython_jar_path>	Specifies the Jython JAR file location.
TRAFCI_PERL_JSERVER_PORT=<port_number>	Specifies the port on which the JavaServer is listening.

The Trafodion Command Interface Installer Wizard can attempt to automatically download and install both the Perl JavaServer and Jython open source extensions. If you wish to download and install them manually, refer to the instructions in the `README` file in the samples directory.

To set the login environment variables, see the instructions for the operating system of the client workstation:

- [Set the Login Environment Variables on Windows](#).
- [Set the Login Environment Variables on Linux or Unix](#).

The Perl and Python wrapper scripts do not require these environment variables:

- `TRAFCI_SERVER`
- `TRAFCI_USER`
- `TRAFCI_PASSWORD`

7.1.1. Set the Login Environment Variables on Windows

You can set the login environment variables for the session at command prompts, or you can set the login environment variables for the system or user by including them in the System Properties.

Set Login Environment Variables on the Command Line

At each command prompt, enter one of these commands:

```
set TRAFCI_PERL_JSERVER=<absolute-path-of-JavaServer.jar>  
set TRAFCI_PYTHON_JSERVER=<absolute-path-of-Jython.jar>  
set TRAFCI_PERL_JSERVER_PORT=<portnumber>
```

7.1.2. Set Login Environment Variables in the System Properties

1. Right-click the **Computer** icon on your desktop, and then select **Properties**:

2. In the **Control Panel**, click the **Advanced** system settings.
3. In the **System Properties** dialog box, click the **Advanced** tab.

4. Click the **Environment Variables** button:

5. In the **Environment Variables** dialog box, click **New** under *System* or *User* variables, whichever you prefer.

6. In the **New System Variable** (or **New User Variable**) dialog box, type the name of the login environment variable for the *Variable Name* and the required value for the *Variable Value*, and then click **OK**:

7. Verify that the environment variable appears under *System* or *User* variables.
8. Repeat [Step 5](#) to [Step 7](#) for each login environment variable.
9. After adding all three environment variables, click **OK** in the **Environment Variables and System Properties** dialog boxes to accept the changes.

7.1.3. Set the Login Environment Variables on Linux or UNIX

You can set the login environment variables for the session at command prompts, or you can set the login environment variables for each user by including the variables in the user profile on a Linux or UNIX client workstation.

Set Login Environment Variables on the Command Line

At each command prompt in any shell except the C shell, enter one of these commands:

```
export TRAFCI_PERL_JSERVER=<absolute-path-of-JavaServer.jar>
export TRAFCI_PYTHON_JSERVER=<absolute-path-of-Jython.jar>
export TRAFCI_PERL_JSERVER_PORT=<portnumber>
```

At each command prompt in the C shell, enter one of these commands:

```
setenv TRAFCI_PERL_SERVER=<absolute-path-of-JavaServer.jar>
setenv TRAFCI_PYTHON_JSERVER=<absolute-path-of-Jython.jar>
setenv TRAFCI_PERL_JSERVER_PORT=<portnumber>
```

Setting Login Environment Variables in the User Profile

To set the login environment variables in the user profile:

1. Open the user profile (`.profile` or `.bash_profile` for the Bash shell) in the `$HOME` directory.

Example

```
vi .profile
```

2. Add these `export` commands (or `setenv` commands for the C shell) to the user profile.

Example

```
export TRAFCI_PERL_JSERVER=<absolute-path-of-JavaServer.jar>
export TRAFCI_PYTHON_JSERVER=<absolute-path-of-Jython.jar>
export TRAFCI_PERL_JSERVER_PORT=<portnumber>
```

3. To activate the changes, either log out and log in again or execute the user profile.

Example

```
. .profile
```

7.2. Perl and Python Wrapper Scripts

The Perl or Python wrapper scripts enable you to run SQL statements and script files using a single connection or multiple connections within Perl or Python programs. The Perl wrapper script is `trafci.pl`, and the Python wrapper script is `trafci.py`. By default, these wrapper scripts are located in the `bin` directory:

Operating System	Directory
Windows	<trafci-installation-directory>\Trafodion Command Interface\bin
Linux/Unix	<trafci-installation-directory>/trafci/bin

trafci-installation-directory is the directory where you installed the trafci software files.

7.3. Launch trafci From the Perl or Python Command Line

You can launch the Perl or Python wrapper scripts as shown below:

Language	Launch Command	Example
Perl	<code>perl trafci.pl <perl-script-filename></code>	<code>> perl trafci.pl example.pl</code>
Python	<code>python trafci.py <python-script-filename></code>	<code>> python trafci.py example.py</code>

7.3.1. Example Perl Program (sample.pl)

You can download the `sample.pl` example from

http://trafodion.incubator.apache.org/docs/command_interface/resources/source/sample.pl.

Alternatively, copy and paste the following code into a file named `sample.pl`:

```
use lib 'C:\\Program Files (x86)\\Apache Software Foundation\\Trafodion Command
Interface\\lib\\perl';
use Session;

# create a new session
$sess = Session->new();

# connect to the database
$sess->connect("user1","password","16.123.456.78","23400");

$retval=$sess->execute(" set schema TRAFODION.CI_SAMPLE ");
print $retval;

# Execute sample queries
$retval=$sess->execute("select * from employee"); print $retval;
$retval=$sess->execute("get statistics"); print $retval;

# disconnect from the database
print "\\n\\nSession 1: Disconnecting first session. \\n\\n";
$sess->disconnect();
```

7.3.2. Example Python Program (sample.py)

You can download the `sample.py` example from

http://trafodion.incubator.apache.org/docs/command_interface/resources/source/sample.py.

Alternatively, copy and paste the following code into a file named `sample.py`:

```
import os import sys

## Modify this path
sys.path.append("C:\\Program Files (x86)\\Apache Software Foundation\\Trafodion Command
Interface\\lib\\python")
import Session

# create a new session
sess = Session.Session()

# Connect to the database
x=sess. connect ("user1","password","16.123.456.78","23400")

# Execute sample queries

# execute takes the query string as argument
setSchema = "set schema TRAFODION.CI_SAMPLE"
selectTable = "select * from employee"
getStats = "get statistics"

#Construct a list of SQL statements to be executed
queryList = [setSchema, selectTable, getStats] print "\n";

for query in queryList:
    print sess.execute (query)

# disconnect the session
sess.disconnect()
del sess
sess=None
```

Chapter 8. Commands

TrafCI supports these commands in the command-line interface or in script files that you run from the command-line interface.

Command	Description	Documentation
@	Runs the SQL statements and interface commands contained in a specified script file.	@ Command
/	Runs the previously executed SQL statement.	/ Command
ALIAS	Maps a string to any interface or SQL command.	ALIAS Command
CLEAR	Clears the command console so that only the prompt appears at the top of the screen.	CLEAR Command
CONNECT	Creates a new connection to the Trafodion database from a current or existing TrafCI session.	CONNECT Command
DELAY	Allows the TrafCI session to be in sleep mode for the specified interval.	DELAY Command
DISCONNECT	Terminates the connection to the Trafodion database.	DISCONNECT Command
ENV	Displays attributes of the current TrafCI session.	ENV Command
EXIT	Disconnects from and exits the command-line interface.	EXIT Command
FC	Edits and re-executes a previous command. This command is restricted to the command-line interface and is disallowed in script files.	FC Command
GET STATISTICS	Returns formatted statistics for the last executed SQL statement.	GET STATISTICS Command
GOTO	Jumps to a point the command history specified by the LABEL Command .	GOTO Command
HELP	Displays help text for the interface commands.	HELP Command
HISTORY	Displays recently executed commands.	HISTORY Command
IF&8230;THEN	Allows the conditional execution of actions specified within the <code>IF...THEN</code> conditional statement.	IF...THEN Command
LABEL	Marks a point in the command history that you can jump to by using the GOTO Command .	LABEL Command
LOCALHOST	Executes client machine commands.	LOCALHOST Command
LOG	Logs commands and output from TrafCI to a log file.	LOG Command
OBEY	Runs the SQL statements and interface commands contained in a specified script file.	OBEY Command
PRUN	Runs script files in parallel.	PRUN Command
QUIT	Disconnects from and exits TrafCI.	QUIT Command
RECONNECT	Creates a new connection to the Trafodion database using the login credentials of the last successful connection.	RECONNECT Command
REPEAT	Re-executes a command.	REPEAT Command
RESET LASTERROR	Resets the last error code to 0.	RESET LASTERROR Command
RESET PARAM	Clears all parameter values or a specified parameter value in the current session.	RESET PARAM Command
RUN	Runs the previously executed SQL statement.	RUN Command
SAVEHIST	Saves the session history in a user-specified file.	SAVEHIST Command

Command	Description	Documentation
SESSION	Displays attributes of the current TrafCI session.	SESSION Command
SET COLSEP	Sets the column separator and allows you to control the formatting of the result displayed for SQL queries.	SET COLSEP Command
SET FETCHSIZE	Changes the default fetchsize used by JDBC.	SET FETCHSIZE Command
SET HISTOPT	Sets the history option and controls how commands are added to the history buffer.	SET HISTOPT Command
SET IDLETIMEOUT	Sets the idle timeout value for the current session.	SET IDLETIMEOUT
SET LIST_COUNT	Sets the maximum number of rows to be returned by <code>SELECT</code> statements that are executed after this command.	SET LIST_COUNT Command
SET MARKUP	Sets the markup format and controls how results are displayed by TrafCI.	SET MARKUP Command
SET PARAM	Sets a parameter value in the current session.	SET PARAM Command
SET PROMPT	Sets the prompt of the current session to a specified string or to a session variable.	SET PROMPT Command
SET SQLPROMPT	Sets the SQL prompt of the current session to a specified string. The default is <code>SQL</code> .	SET SQLPROMPT Command
SET SQLTERMINATOR	Sets the SQL statement terminator of the current session to a specified string. The default is a semicolon (<code>;</code>).	SET SQLTERMINATOR Command
SET STATISTICS	Automatically retrieves the statistics information for a query being executed.	SET STATISTICS Command
SET TIME	Causes the local time of the client workstation to be displayed as part of the interface prompt.	SET TIME Command
SET TIMING	Causes the elapsed time to be displayed after each SQL statement executes.	SET TIMING Command
SHOW ACTIVITYCOUNT	Functions as an alias of SHOW RECCOUNT Command .	SHOW ACTIVITYCOUNT Command
SHOW ALIAS	Displays all or a set of aliases available in the current TrafCI session.	SHOW ALIAS Command
SHOW ALIASES	Displays all the aliases available in the current TrafCI session.	SHOW ALIASES Command
SHOW CATALOG	Displays the current catalog of the TrafCI session.	SHOW CATALOG Command
SHOW COLSEP	Displays the value of the column separator for the current TrafCI session.	SHOW COLSEP Command
SHOW ERRORCODE	Functions as an alias for the SHOW LASTERROR Command .	SHOW ERRORCODE Command
SHOW FETCHSIZE	Displays the fetch size value for the current TrafCI session.	SHOW FETCHSIZE Command
SHOW HISTOPT	Displays the value that has been set for the history option of the current setting.	SHOW HISTOPT Command
SHOW IDLETIMEOUT	Displays the idle timeout value of the current session.	SHOW IDLETIMEOUT Command
SHOW LASTERROR	Displays the last error of the statement that was executed.	SHOW LASTERROR Command
SHOW LIST_COUNT	Displays the maximum number of rows to be returned by <code>SELECT</code> statements in the current session.	SHOW LIST_COUNT Command
SHOW MARKUP	Displays the value that has been set for the markup option for the current TrafCI session.	SHOW MARKUP Command
SHOW PARAM	Displays the parameters that are set in the current session.	SHOW PARAM Command
SHOW PREPARED	Displays the prepared statements in the current TrafCI session.	SHOW PREPARED Command

Command	Description	Documentation
SHOW RECCOUNT	Displays the record count of the previous executed SQL statement.	SHOW RECCOUNT Command
SHOW REMOTEPROCESS	Displays the process name of the DCS server that is handling the current connection.	SHOW REMOTEPROCESS Command
SHOW SCHEMA	Displays the current schema of the TrafCI session.	SHOW SCHEMA Command
SHOW SESSION	Displays attributes of the current TrafCI session.	SHOW SESSION Command
SHOW SQLPROMPT	Displays the value of the SQL prompt for the current session.	SHOW SQLPROMPT Command
SHOW SQLTERMINATOR	Displays the SQL statement terminator of the current session.	SHOW SQLTERMINATOR Command
SHOW STATISTICS	Displays if statistics has been enabled or disabled for the current session.	SHOW STATISTICS Command
SHOW TIME	Displays the setting for the local time in the SQL prompt.	SHOW TIME Command
SHOW TIMING	Displays the setting for the elapsed time.	SHOW TIMING Command
SPOOL	Logs commands and output from TrafCI to a log file.	SPOOL Command
VERSION	Displays the build versions of the platform, database connectivity services, JDBC Type 4 Driver, and TrafCI.	VERSION Command

8.1. @ Command

The @ command executes the SQL statements and interface commands contained in a specified script file. The @ command is executed the same as the OBEY command. For more information on syntax and considerations, [OBEY Command](#).

8.1.1. Syntax

```
@{script-file | wild-card-pattern} [(section-name)]
```

- *script-file*

is the name of an ASCII text file that contains SQL statements, interface commands, and comments. If the script file exists outside the local directory where you launch TrafCI (by default, the `bin` directory) specify the full directory path of the script file.

- *wild-card-pattern*

is a character string used to search for script files with names that match the character string. *wild-card-pattern* matches a string, depending on the operating system for case-sensitivity, unless you enclose it within double quotes. To look for similar values, specify only part of the characters of *wild-card-pattern* combined with these wild-card characters:

- | | |
|---|---|
| * | Use an asterisk () to indicate zero or more characters of any type. For example, <code>*art</code> matches <code>SMART</code> , <code>ARTIFICIAL</code> , and <code>PARTICULAR</code> . |
| ? | Use a question mark (?) to indicate any single character. For example, <code>boo?</code> matches <code>BOOK</code> and <code>BOOT</code> but not <code>BOO</code> or <code>BOOTS</code> . |

- *(section-name)*

is the name of a section within the *script-file* to execute. If you specify *section-name*, the @ command executes the commands between the header line for the specified section and the header line for the next section (or the end of the script file). If you omit *section-name*, the @ command executes the entire script file. For more information, [Section Headers](#).

8.1.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- Space is disallowed between the @ sign and the first character of the script name.
- For additional considerations, see the [OBEY Command](#).

8.1.3. Examples

- This @ command runs the script file from the local directory (the same directory where you are running TrafCI):

```
SQL> @ddl.sql
```

- This @ command runs the script file in the specified directory on a Windows workstation:

```
SQL> @c:\my_files\ddl.sql
```

- This @ command runs the script file in the specified directory on a Linux or UNIX workstation:

```
SQL> @./my_files/ddl.sql
```

8.2. / Command

The `/` command executes the previously executed SQL statement. This command does not repeat an interface command.

8.2.1. Syntax

```
/
```

8.2.2. Considerations

- You must enter the command on one line.
- The command does not require an SQL terminator.

8.2.3. Example

This `/` command executes the previously executed `SELECT` statement:

```
SQL> SELECT COUNT() FROM persnl.employee;

(Expr)
-----
62

--- 1 row(s) selected.

`SQL> `/

(Expr)
-----
62

--- 1 row(s) selected.

SQL>
```

8.3. ALIAS Command

The `ALIAS` command allows you to map a string to any interface or SQL command. The syntax of the interface or SQL command is checked only when the mapped string is executed. This command replaces only the first token of a command string, which allows the rest of the tokens to be treated as parameters.

8.3.1. Syntax

```
ALIAS value AS command SQL-terminator
```

- *value*

is a case-insensitive string without spaces. *Value* cannot be a command.

- *command*

is an command or SQL command.

- *SQL-terminator*

is the default terminator (`;`) or a string value defined for the statement terminator by the [SET SQLTERMINATOR Command](#). For more information, see [Set and Show the SQL Terminator](#).

8.3.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- The `ALIAS` command lasts only for the duration of the session.
- An alias on an alias is not supported.

8.3.3. Examples

- This command creates an alias named `.OS` to perform the `LOCALHOST (LH)` command:

```
SQL> ALIAS .OS AS LH;
```

- This command executes the new `ALIAS` with the `ls` option:

```
SQL> .OS ls  
  
trafci-perl.pl trafci-python.py trafci.cmd trafci.pl trafci.py trafci.sh
```

- This command creates an alias named `.GOTO` to perform the `GOTO` command:

```
SQL> ALIAS .GOTO AS GOTO;  
SQL> .GOTO mylabel
```

The `GOTO` statement executed, ignoring all commands until a `'LABEL MYLABEL'` command is encountered.

- This command creates an alias named `USE` to perform the `SET SCHEMA` operation, uses the alias to set the schema to `TRAFODION.USR`, and checks the current schema to verify that the alias worked correctly:

```
SQL> ALIAS use AS "SET SCHEMA";  
SQL> use TRAFODION.USR;  
SQL> SHOW SCHEMA  
  
SCHEMA USR
```

8.4. CLEAR Command

The `CLEAR` command clears the interface window so that only the prompt appears at the top of the window. `CLEAR` does not clear the log file or reset the settings of the session.

8.4.1. Syntax

```
CLEAR
```

8.4.2. Considerations

- You must enter the command on one line.
- The `CLEAR` command does not require an SQL terminator.

8.4.3. Example

This `CLEAR` command clears the interface window:

```
SQL> CLEAR
```

After the `CLEAR` command executes, the interface window appears with only the prompt showing:

```
SQL>
```

8.5. CONNECT Command

The `CONNECT` command creates a new connection to the database from the current or existing TrafCI session.

8.5.1. Syntax

```
CONNECT [ username [ /password ][@hostname]]
```

- *username*

specifies the user name for logging in to the database platform.

- If the user name is not specified, then TrafCI prompts for the user name.
- If the user name contains spaces or special characters, such as a period (.), hyphen (-), or underscore (_), then put the name within double quotes. For example: "**sq.user-1**".

- */password*

specifies the password of the user for logging in to the database platform.

- If the password is not specified, then TrafCI prompts for the password.
- If the password contains spaces or special characters, such as @ or a single quote ('), then put the password within double quotes. For example: "**Tr@f0d!0n**".

- *@hostname*

specifies the host name or IP address of the database platform to which you want the client to connect.

- If the hostname is not specified, then the value is automatically used from the current TrafCI session.
- If TrafCI was invoked with the `-noconnect` launch parameter, then you are prompted for a *hostname* value.

8.5.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- If TrafCI was invoked with the `-noconnect` launch parameter, then TrafCI prompts you for the values.
- If the user name or password contains space or special characters, then you must put the name or password within double quotes.

8.5.3. Examples

- This command creates a new connection to the Trafodion database from the current or existing TrafCI session:

```
SQL> CONNECT

User Name: user1
Password:

Connected to Trafodion
```

- This command creates a new connection to the Trafodion database from the current or existing TrafCI session:

```
SQL> CONNECT user1/password

Connected to Trafodion
```

- This command creates a new connection to the Trafodion database from the current or existing TrafCI session:

```
SQL> CONNECT user1/password@host0101

Connected to Trafodion
```

- This command creates a new connection to the Trafodion database from the current or existing TrafCI session:

```
SQL> CONNECT user2

Password:

Connected to Trafodion
```

8.6. DELAY Command

The `DELAY` command allows the TrafCI session to be in sleep mode for the specified interval.

8.6.1. Syntax

```
DELAY time [sec[ond][s] | min[ute][s]]
```

- *time*

is an integer.

8.6.2. Considerations

- If `seconds` or `minutes` are not specified, then the default is `seconds`.
- The maximum delay limit is 3600 seconds. You can override this value by setting `trafci.maxDelayLimit` in `_JAVA_OPTIONS`. The unit is seconds for `trafci.maxDelayLimit`.
- This command does not require an SQL terminator.

8.6.3. Examples

- This `DELAY` command puts the TrafCI session to sleep for 5 seconds before executing the next command:

```
SQL> DELAY 5 secs
SQL> SHOW VIEWS
```

- This `DELAY` command puts TrafCI session to sleep for 5 minutes before executing the next command, which is to exit the session:

```
SQL> DELAY 5 mins
SQL> EXIT
```

8.7. DISCONNECT Command

The DISCONNECT command terminates the connection from the database, not from TrafCI.

8.7.1. Syntax

```
DISCONNECT [WITH] [status] [IF {condition}]
```

- *status*

is any 1-byte integer. *status* is a shell return value, and the range of allowable values is platform dependent.
- *condition*

is the same as the condition parameter defined for the [IF&8230;THEN Command](#). See [Condition Parameter](#).

8.7.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- After you disconnect from the Trafodion database, you can still run these interface commands:

ALIAS	HELP	SAVEHIST	SET/SHOW SQLTERMINATOR
CLEAR	HISTORY	SESSION	SET/SHOW TIME
CONNECT	LABEL	SET/SHOW COLSEP	SET/SHOW TIMING
DELAY	LOCALHOST	SET/SHOW HISTOPT	SHOW ALIAS/ALIASES
DISCONNECT	LOG	SET/SHOW IDLETIMEOUT	SHOW SESSION
ENV	QUIT	SET/SHOW MARKUP	SPOOL
EXIT	REPEAT	SET/SHOW PARAM	VERSION
FC	RESET LASTERROR	SET PROMPT	GOTO

8.7.3. Examples

This command terminates the connection to the Trafodion database. You can connect to the Trafodion database by using the `CONNECT` and `RECONNECT` commands:

```
SQL> DISCONNECT
```

```
Session Disconnected. Please connect to the database by using  
connect/reconnect command.
```

8.8. ENV Command

ENV displays attributes of the current TrafCI session. You can also use the `SESSION` and `SHOW SESSION` commands to perform the same function.

8.8.1. Syntax

```
ENV
```

8.8.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- ENV displays these attributes:

Attribute	Description
COLSEP	Current column separator, which is used to control how query results are displayed. For more information, see SET COLSEP Command .
HISTOPT	Current history options, which controls how the commands are added to the history buffer. For more information, see SET HISTOPT Command .
IDLETIMEOUT	Current idle timeout value, which determines when the session expires after a period of inactivity. By default, the idle timeout is 30 minutes. For more information, see Set and Show Session Idle Timeout Value and SET IDLETIMEOUT Command .
LIST_COUNT	Current list count, which is the maximum number of rows that can be returned by SELECT statements. By default, the list count is all rows. For more information, see SET LIST_COUNT Command .
LOG FILE	Current log file and the directory containing the log file. By default, logging during a session is turned off. For more information, see Log Output , and LOG Command or SPOOL Command .
LOG OPTIONS	Current logging options. By default, logging during a session is turned off, and this attribute does not appear in the output. For more information, see the LOG Command or SPOOL Command .
MARKUP	Current markup option selected for the session. The default option is RAW. For more information, see SET MARKUP Command .
PROMPT	Current prompt for the session. For example, the default is SQL>. For more information, see Customize the Standard Prompt and SET PROMPT Command .
SCHEMA	Current schema. The default is <code>USR</code> . For more information, see Set and Show the Current Schema .
SERVER	Host name and port number that you entered when logging in to the database platform. For more information, see Log In to Database Platform .
SQLTERMINATOR	Current SQL statement terminator. The default is a semicolon (;). For more information, see Set and Show the SQL Terminator and SHOW SQLTERMINATOR Command .
STATISTICS	Current setting (on or off) of statistics. For more information, see the SET STATISTICS Command .
TIME	Current setting (on or off) of the local time as part of the prompt. When this command is set to on, military time is displayed. By default, the local time is off. For more information, see Customize the Standard Prompt and SET TIME Command .
TIMING	Current setting (on or off) of the elapsed time. By default, the elapsed time is off. For more information, see Display the Elapsed Time and SET TIMING Command .

Attribute	Description
USER	User name that you entered when logging in to the database platform. For more information, Log In to Database Platform .

8.8.3. Examples

- This ENV command displays the attributes of the current session:

```
SQL> ENV

COLSEP           " "
HISTOPT          DEFAULT [No expansion of script files]
IDLETIMEOUT      0 min(s) [Never Expires]
LIST_COUNT       0 [All Rows]
LOG FILE         c:\session.txt
LOG OPTIONS      APPEND,CMDTEXT ON
MARKUP           RAW
PROMPT           SQL>
SCHEMA           SEABASE
SERVER           sqws135.houston.host.com:23400
SQLTERMINATOR    ;
STATISTICS       OFF
TIME             OFF
TIMING           OFF
USER             user1
```

- This ENV command shows the effect of setting various session attributes:

```
4:16:43 PM > ENV

COLSEP           " "
HISTOPT          DEFAULT [No expansion of script files]
IDLETIMEOUT      30 min(s)
LIST_COUNT       0 [All Rows]
LOG              OFF
MARKUP           RAW
PROMPT           SQL>
SCHEMA           SEABASE
SERVER           sqws135.houston.host.com:23400
SQLTERMINATOR    ;
STATISTICS       OFF
TIME             OFF
TIMING           OFF
USER             user1

4:16:49 PM >
```

8.9. EXIT Command

The `EXIT` command disconnects from and exits TrafCI. `EXIT` can return a status code. If no status code is specified, then 0 (zero) is returned by default. In addition, a conditional statement can be appended to the command.

8.9.1. Syntax

```
EXIT [WITH] [status] [IF {condition}]
```

- *status*

is any 1-byte integer. *status* is a shell return value, and the range of allowable values is platform dependent.

- *condition*

is the same as the condition parameter defined for the [IF&8230;THEN Command](#). See [Condition Parameter](#).

8.9.2. Considerations

You must enter the command on one line. The command does not require an SQL terminator.

8.9.3. Examples

- This command disconnects from and exits TrafCI, which disappears from the screen:

```
SQL> EXIT
```

- In a script file, the conditional exit command causes the script file to quit running and disconnect from and exit TrafCI when the previously run command returns error code 4082:

```
LOG c:\errorCode.log
SELECT * FROM employee;
EXIT IF errorcode=4082
LOG OFF
```

These results are logged when error code 4082 occurs:

```
SQL> SELECT * FROM employee;

**** ERROR[4082] Table, view or stored procedure TRAFODION.USR.EMPLOYEE does not
exist or is inaccessible.

SQL> EXIT IF errorcode=4082
```

- The following two examples are equivalent:

```
SQL> EXIT -1 IF LASTERROR <> 0
SQL> EXIT WITH -1 IF LASTERROR != 0
```

- This example exits TrafCI if the last error code is equal to 4082:

```
SQL> EXIT WITH 82 IF LASTERROR == 4082
SQL> EXIT -- default status is 0
```

8.10. FC Command

The `FC` command allows you to edit and reissue a command in the history buffer of an TrafCI session. You can display the commands in the history buffer by using the `HISTORY` command. For information about the history buffer, see the [HISTORY Command](#).

8.10.1. Syntax

```
FC [text | [-]number]
```

- *text*

is the beginning text of a command in the history buffer. Case is not significant in matching the text to a command.

- *number*

is either a positive integer that is the ordinal number of a command in the history buffer or a negative integer that indicates the position of a command relative to the most recent command.

Without text or number, `FC` retrieves the most recent command.

8.10.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- You cannot execute this command in a script file. You can execute this command only at a command prompt.
- As each line of the command is displayed, you can modify the line by entering these editing commands (in uppercase or lowercase letters) on the line below the displayed command line:

Edit Command	Description
D	Deletes the character immediately above the letter D. Repeat to delete more characters.
`I` <i>characters</i>	Inserts characters in front of the character immediately above the letter I.
`R` <i>characters</i>	Replaces existing characters one-for-one with characters, beginning with the character immediately above the letter R.
<i>characters</i>	Replaces existing characters one-for-one with characters, beginning with the first character immediately above characters. <i>`characters`</i> must begin with a non-blank character.

To specify more than one editing command on a line, separate the editing commands with a double slash (/ /). The end of a line terminates an editing command or a set of editing commands.

After you edit a line of the command, TrafCI displays the line again and allows you to edit it again. Press **Enter** without specifying editing commands to stop editing the line. If that line is the last line of the command, pressing **Enter** executes the command.

To terminate a command without saving changes to the command, use the double slash (/ /), and then press **Enter**.

8.10.3. Examples

- Re-execute the most recent command that begins with SH:

```
SQL> FC SH
SQL> SHOW SCHEMA
. . . .
```

Pressing **Enter** executes the `SHOW SCHEMA` command and displays the current schema, `PERSNL`:

```
SQL> FC SH
SQL> SHOW SCHEMA
. . . .

SCHEMA PERSNL

SQL>
```

- Correct an SQL statement that you entered incorrectly by using the delete (D) editing command:

```
SQL> SELECT * FROM persnl.employee;

*** ERROR[15001] A syntax error occurred at or before:
SELECCT * FROM persnl.employee;
    ^

SQL> FC
SQL> SELECCT * FROM persnl.employee;
....      d
SQL>SELECT * FROM persnl.employee;
....
```

Pressing **Enter** executes the corrected `SELECT` statement.

- Correct an SQL statement that you entered incorrectly by using more than one editing command:

```
SQL> SELT * FROMM persnl.employee;

*** ERROR[15001] A syntax error occurred at or before:
SELT * FROMM persnl.employee;
    ^

SQL> FC
SQL> SELT * FROMM persnl.employee;
....      iEX//      d
SQL> SELECT * FROM persnl.employee;
....
```

Pressing **Enter** executes the corrected `SELECT` statement.

- Modify a previously executed statement by replacing a value in the `WHERE` clause with another value:

```
SQL> SELECT first_name, last_name
+> FROM persnl.employee
+> WHERE jobcode=111;

--- 0 row(s) selected.

SQL> FC
SQL> SELECT first_name, last_name
....
SQL> FROM persnl.employee
....
SQL> WHERE jobcode=111;
                450
....
SQL> WHERE jobcode=450;
....
```

Pressing Enter lists the first and last names of all of the employees whose job code is 450.

- Modify a previously executed statement by replacing a column name in the select list with another column name:

```
SQL> SELECT first_name, last_name
+> FROM persnl.employee
+> WHERE jobcode=450;

FIRST_NAME      LAST_NAME
-----
MANFRED         CONRAD
WALTER          LANCASTER
JOHN            JONES
KARL            HELMSTED
THOMAS          SPINNER

--- 5 row(s) selected.

SQL> FC
SQL> SELECT first_name, last_name
....      R    empnum,
SQL> SELECT      empnum, last_name
....

SQL> FROM persnl.employee
....

SQL> WHERE jobcode=450;
....
```

Pressing **Enter** lists the employee number and last names of all employees whose job code is 450:

```
EMPNUM LAST_NAME
-----
 180  CONRAD
 215  LANCASTER
 216  JONES
 225  HELMSTED
 232  SPINNER

--- 5 row(s) selected.
SQL>
```

8.11. GET STATISTICS Command

The GET STATISTICS command returns formatted statistics for the last executed SQL statement.

8.11.1. Syntax

```
GET STATISTICS
```

8.11.2. Description of Returned Values

Value	Description
Records Accessed	Number of rows returned by disk process to <code>EID</code> (Executor In Disk process).
Records Used	Number of rows returned by <code>EID</code> after selection.
Disk IOs	Number of actual disk IOs done by disk process.
Message Count	Number of messages sent/received between file system and disk process.
Message Bytes	Number of message bytes sent/received between file system and disk process.
Lock Escl	Number of lock escalations.
Lock Wait	Number of lock waits.
Disk Process Busy Time	CPU time for disk process processes for the specified table.

8.11.3. Considerations

The command requires an SQL terminator.

8.11.4. Examples

```
SQL> SELECT * FROM job;
```

```
JOBCODE  JOBDESC
-----
100      MANAGER
1234     ENGINEER
450      PROGRAMMER
900      SECRETARY
300      SALESREP
500      ACCOUNTANT
400      SYSTEM ANALYST
250      ASSEMBLER
420      ENGINEER
600      ADMINISTRATOR
200      PRODUCTION SUPV
```

```
--- 11 row(s) selected.
```

```
SQL> GET STATISTICS;
```

```
Start Time      21:45:34.082329
End Time        21:45:34.300265
Elapsed Time    00:00:00.217936
Compile Time    00:00:00.002423
Execution Time  00:00:00.218750
```

Table Name	Records Accessed	Records Used	Disk I/Os	Message Count	Message Bytes	Lock Escl	Lock Wait	Disk Busy	Process Time
TRAFODION.TOI.JOB	2		2	0	4	15232	0	0	363

```
--- SQL operation complete.
```

8.12. GOTO Command

The GOTO command allows you to jump to a designated point in the command history. The point in the command history is designated by a LABEL command. All commands executed after a GOTO statement are ignored until the specified label is set. To set a label, use the [LABEL Command](#).

8.12.1. Syntax

```
GOTO {label}
```

- *label*

is a string of characters without quotes and spaces, or a quoted string.

8.12.2. Considerations

- You must enter the command on one line.
- The GOTO command cannot currently jump back in the command history; it is a forward-only command.

8.12.3. Examples

These examples show the use of the GOTO and LABEL commands:

```
SQL> GOTO ViewManagers
SQL> SELECT  FROM Employees; -- skipped
SQL> SHOW RECCOUNT;          -- skipped
SQL> LABEL ViewManagers
SQL> SELECT  FROM Managers;
SQL> GOTO "View Customers"
SQL> SELECT  FROM Invoices;  -- skipped
SQL> LABEL "View Customers"
SQL> SELECT  FROM Customers;
```

8.13. HELP Command

The HELP command displays help text for the commands. See [Commands](#) for a descriptions of the commands.

8.14. Syntax

```
HELP [command-name]
```

command-name

is the name of a command.

- If you do not specify a command, then TrafCI returns a list of all commands.
- If you specify `SET`, then TrafCI returns a list of all `SET` commands.
- If you specify `SHOW`, then TrafCI returns a list of all `SHOW` commands.

8.14.1. Considerations

You must enter the command on one line. The command does not require an SQL terminator.

8.14.2. Examples

- This `HELP` command lists all the interface commands that are supported:

```
SQL> HELP
```

- This `HELP` command lists all the `SET` commands that are supported:

```
SQL> HELP SET
```

- This `HELP` command lists all the `SHOW` commands that are supported:

```
SQL> HELP SHOW
```

- This `HELP` command shows help text for `SET IDLETIMEOUT`:

```
SQL> HELP SET IDLETIMEOUT
```

8.15. HISTORY Command

The `HISTORY` command displays recently executed commands, identifying each command by a number that you can use to re-execute or edit the command.

8.15.1. Syntax

```
HISTORY [number]
```

- *number*

is the number of commands to display. The default number is 10. The maximum number is 100.

8.15.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- You can use the `FC` command to edit and re-execute a command in the history buffer, or use the `REPEAT` command to re-execute a command without modifying it. See [FC Command](#) or [REPEAT Command](#).

8.15.3. Example

Display the three most recent commands and use `FC` to redisplay one:

```
SQL> HISTORY 3

14> SET SCHEMA SALES;
15> SHOW TABLES
16> SHOW VIEWS

SQL> FC 14

SQL> SET SCHEMA sales
....
```

Now you can use the edit capabilities of `FC` to modify and execute a different `SET SCHEMA` statement.

8.16. IF...THEN Command

IF...THEN statements allow for the conditional execution of actions. If the condition is met, the action is executed; otherwise, no action is taken.

8.16.1. Syntax

```
IF {condition} THEN {action} {SQL-terminator}
```

- *condition*

The condition parameter (*condition*) is a Boolean statement structured as follows:

```
( {variable-name | value} {operator} {variable-name | value}
```

- *variable-name*

is one of:

```
{ LASTERROR  
| RECCOUNT  
| ACTIVITYCOUNT  
| ERRORCODE  
| [%]any ENV variable | any SQL parameter  
}
```

- *value*

is any integer or a quoted string, where the quoted string is any non-quote character. \ is the optional escape character.

- *operator*

is one of:

Operator	Meaning
== =	equal to
<> != ~= ^=	not equal to
>	greater than
>=	greater than or equal to
<	less than
<=	less than or equal to

- *action*

The action parameter (*action*) is any interface or SQL command.

- *SQL Terminator*

The SQL terminator (*SQL-terminator*) is the default terminator (;) or a string value defined for the statement terminator by the [SET SQLTERMINATOR Command](#). See [Set and Show the SQL Terminator](#).

8.16.2. Considerations

- IF...THEN is itself an action. Thus, nested IF...THEN statements are allowed.
- An action must end with the SQL terminator, even if the action is an interface command.

8.16.3. Examples

These commands show multiple examples of IF...THEN statements:

```
SQL> INVOKE employees
SQL> -- ERROR 4082 means the table does not exist
SQL> IF ERRORCODE != 4082 THEN GOTO BeginPrepare
SQL> CREATE TABLE employees(ssn INT PRIMARY KEY NOT NULL NOT DROPPABLE, fname
VARCHAR(50), lname VARCHAR(50), hiredate DATE DEFAULT CURRENT_DATE);
SQL> LABEL beginprepare
SQL> PREPARE empSelect FROM
+> SELECT * FROM
+> employees
+> WHERE SSN=?empssn;
SQL> IF user == "alice" THEN SET PARAM ?empssn 987654321;
SQL> IF %user == "bob" THEN SET PARAM ?empssn 123456789;
SQL> EXECUTE empselect
SQL> IF user == "alice" THEN
+> IF activitycount == 0 THEN GOTO insertalice;
SQL> IF user == "bob" THEN IF activitycount == 0 THEN GOTO insertbob;
SQL> EXIT
SQL> LABEL insertalice
SQL> INSERT INTO employees(ssn, fname, lname) VALUES(987654321, 'Alice', 'Smith');
SQL> EXIT
SQL> LABEL insertbob
SQL> INSERT INTO employees(ssn, fname, lname) VALUES(123456789, 'Bob', 'Smith');
SQL> EXIT
```

8.17. LABEL Command

The LABEL command marks a point in the command history that you can jump to by using the GOTO command. For more information, see the [GOTO Command](#).

8.17.1. Syntax

```
LABEL {label}
```

- *label*

is a string of characters without quotes and spaces, or a quoted string.

8.17.2. Considerations

You must enter the command on one line.

8.17.3. Examples

- This command creates a label using a string of characters:

```
SQL> LABEL MyNewLabel
```

- This command creates a label using a quoted string:

```
SQL> LABEL "Trafodion Label"
```

8.18. LOCALHOST Command

The `LOCALHOST` command allows you to execute client machine commands.

8.18.1. Syntax

```
LOCALHOST | LH <client M/C commands>
```

8.18.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- The `LOCALHOST` command has a limitation. When input is entered for the operating system commands (for example, `date`, `time`, and `cmd`), the input is not visible until you hit the `enter` key.
- If the `SET TIMING` is set to `ON`, the elapsed time information is displayed.

8.18.3. Examples

- If you are using a Windows system, `dir` lists the contents of the directory name. Similarly, if you are on a UNIX system you enter `LOCALHOST LS` to display the contents of the folder.

```
SQL> LOCALHOST dir

Volume in drive C is E-Client
Volume Serial Number is DC4F-5B3B

Directory of c:\Program Files (x86)\Apache Software Foundation\Trafodion Command
Interface\bin 05/11/2105 01:17 PM <DIR>
05/11/2105 01:17 PM <DIR>
05/16/2105 09:47 AM          1,042 trafci-perl.pl
05/16/2105 09:47 AM          1,017 trafci-python.pl
05/16/2105 09:47 AM           752 trafci.cmd
05/16/2105 09:47 AM          1,416 trafci.pl
05/16/2105 09:47 AM          2,388 trafci.py
05/16/2105 09:47 AM          3,003 trafci.sh
        6 Files(s) 19,491 bytes
        2 Dir (s) 57,686,646,784 bytes free

SQL> LH mkdir c:\trafci -- Will create a directory c:\trafci on your local machine.
```

- This command displays the elapsed time information because the `SET TIMING` command is set to `ON`:

```
SQL> SET TIMING ON
SQL> LOCALHOST ls
```

```
trafci-perl.pl
trafci-python.py
trafci.cmd
trafci.pl
trafci.py
trafci.sh
```

```
Elapsed :00:00:00.078
```

8.19. LOG Command

The `LOG` command logs the entered commands and their output from TrafCI to a log file. If this is an obey script file, then the command text from the obey script file is shown on the console.

8.19.1. Syntax

```
LOG { ON [CLEAR, QUIET, CMDTEXT {ON | OFF}]
      | log-file [CLEAR, QUIET, CMDTEXT {ON | OFF}]
      | OFF
      }
```

- `ON`

starts the logging process and records information in the `sqlspool.lst` file in the `bin` directory.

- `CLEAR`

instructs TrafCI to clear the contents of the `sqlspool.lst` file before logging new information to the file.

- `QUIET`

specifies that the command text is displayed on the screen, but the results of the command are written only to the log file and not to the screen.

- `CMDTEXT ON`

specifies that the command text and the log header are displayed in the log file.

- `CMDTEXT OFF`

specifies that the command text and the log header are not displayed in the log file.

- *log-file*

is the name of a log file into which TrafCI records the entered commands and their output. If you want the log file to exist outside the local directory where you launch TrafCI (by default, the `bin` directory), specify the full directory path of the log file. The log file does not need to exist, but the specified directory must exist before you execute the `LOG` command.

- *log-file* CLEAR

instructs TrafCI to clear the contents of the specified *log-file* before logging new information to the file.

- OFF

stops the logging process.

8.19.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- Use a unique name for each log file to avoid writing information from different TrafCI sessions into the same log file.

8.19.3. Examples

- This command starts the logging process and records information to the `sqlspool.lst` file in the `bin` directory:

```
SQL> LOG ON
```

- This command starts the logging process and appends new information to an existing log file, `persnl_updates.log`, in the local directory (the same directory where you are running TrafCI):

```
SQL> LOG persnl_updates.log
```

- This command starts the logging process and appends new information to a log file, `sales_updates.log`, in the specified directory on a Windows workstation:

```
SQL> LOG c:\log_files\sales_updates.log
```

- This command starts the logging process and appends new information to a log file, `sales_updates.log`, in the specified directory on a Linux or UNIX workstation:

```
SQL> LOG ./log_files/sales_updates.log
```

- This command starts the logging process and clears existing information from the log file before logging new information to the file:

```
SQL> LOG persnl_ddl.log CLEAR
```

- This command start the logging process, clears existing information from the log file, and specifies that the command text and log header is not displayed in the log file:

```
SQL> LOG c:\temp\a.txt clear, CMDTEXT OFF
SQL> (SELECT * FROM trafodion.toi.job
+>;
```

```
JOBCODE  JOBDESC
-----  -
100      MANAGER
450      PROGRAMMER 900 SECRETARY
300      SALESREP
500      ACCOUNTANT
400      SYSTEM ANALYST
250      ASSEMBLER
420      ENGINEER
600      ADMINISTRATOR
200      PRODUCTION SUPV
```

```
--- 10 row(s) selected.
```

```
SQL> log off
```

Output of c:\temp\a.txt

```
JOBCODE  JOBDESC
-----  -
100      MANAGER
450      PROGRAMMER 900 SECRETARY
300      SALESREP
500      ACCOUNTANT
400      SYSTEM ANALYST
250      ASSEMBLER
420      ENGINEER
600      ADMINISTRATOR
200      PRODUCTION SUPV
```

```
--- 10 row(s) selected
```

- This command start the logging process, clears existing information from the log file, specifies that no output appears on the console window, and the quiet option is enabled:

```
SQL> LOG c:\temp\b.txt CLEAR, CMDTEXT OFF, QUIET
SQL> SELECT
+> FROM trafodion.toi.job; +
SQL> LOG OFF
```

Output of c:\temp\b.txt

```
JOBCODE JOBDESC
-----
100      MANAGER
450      PROGRAMMER 900 SECRETARY
300      SALESREP
500      ACCOUNTANT
400      SYSTEM ANALYST
250      ASSEMBLER
420      ENGINEER
600      ADMINISTRATOR
200      PRODUCTION SUPV

--- 10 row(s) selected
```

This command stops the logging process:

```
SQL> LOG OFF
```

For more information, see [Log Output](#).

8.20. OBEY Command

The `OBEY` command executes the SQL statements and interface commands of a specified script file or an entire directory. This command accepts a single filename or a filename with a wild-card pattern specified. Executing the `OBEY` command without optional parameters prompts you to enter a filename. If a filename is not specified, then `*.sql` is used.

8.20.1. Syntax

```
OBEY {script-file | wild-card-pattern} [(section-name)]
```

- *script-file*

is the name of an ASCII text file that contains SQL statements, interface commands, and comments. If the script file exists outside the local directory where you launch TrafCI (by default, the `bin` directory), specify the full directory path of the script file.

- *wild-card-pattern*

is a character string used to search for script files with names that match the character string. *wild-card-pattern* matches a string, depending on the operating system for case-sensitivity, unless you enclose it within double quotes. To look for similar values, specify only part of the characters of *wild-card-pattern* combined with these wild-card characters:

- *(section-name)*

is the name of a section within the *script-file* to execute. If you specify *section-name*, the `OBEY` command executes the commands between the header line for the specified section and the header line for the next section (or the end of the script file). If you omit *section-name*, the `OBEY` command executes the entire script file. For more information, see [Section Headers](#).

8.20.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- Put a space between `OBEY` and the first character of the file name.
- You can execute this command in a script file.
- Before putting dependent SQL statements across multiple files, consider the order of the file execution. If a directory is not passed to the `OBEY` command, the file or wild card is assumed to be in the current working directory.
- If the (*) is issued in the `OBEY` command, all files are executed in the current directory. Some of the files in the directory could be binary files. The `OBEY` command tries to read those binary files and junk or invalid characters are displayed on the console. For example, this command causes invalid characters to be displayed on the console:

```
SQL> OBEY C:\trafci\bin\
```

- `OBEY` detects recursive obey files (for example, an SQL file that calls `OBEY` on itself) and prevents infinite loops using a max depth environment variable. If no variable is passed to the JVM, the default depth is set to 10. To change this depth (for example to a value of 20), pass a Java environment variable as follows:

```
-Dtrafci.obeydepth=20
```

8.20.3. Examples

- This `OBEY` command runs the script file from the local directory (the same directory where you are running TrafCI):

```
SQL> OBEY ddl.sql
```

- This `OBEY` command runs the script file in the specified directory on Windows.

```
SQL> OBEY c:\my_files\ddl.sql
```

- This OBEY command runs the script file in the specified directory on a Linux or UNIX workstation:

```
SQL> OBEY ./my_files/ddl.sql
```

- This sample file contains sections to be used in conjunction with the OBEY command:

```
?section droptable
DROP TABLE course ;

?section create
CREATE TABLE course ( cno VARCHAR(3) NOT NULL
                      , cname VARCHAR(22) NOT NULL
                      , cdescp VARCHAR(25) NOT NULL
                      , cred INT
                      , clabfee NUMERIC(5,2)
                      , cdept VARCHAR(4) NOT NULL
                      , PRIMARY KEY (cno)
                      ) ;

?section insert
INSERT INTO course VALUES ('C11', 'Intro to CS','for Rookies',3, 100, 'CIS') ;
INSERT INTO course VALUES ('C22', 'Data Structures','Very Useful',3, 50, 'CIS') ;
INSERT INTO course VALUES ('C33', 'Discrete Mathematics', 'Absolutely Necessary',3,
0,'CIS') ;

?section select
SELECT * FROM course ;

?section delete
PURGEDATA course;
```

To run only the commands in section create, execute the following:

```
SQL> OBEY C:\Command Interfaces\course.sql (create)

SQL> ?section create
SQL> CREATE TABLE course
+>(
+> cno VARCHAR(3) NOT NULL,
+> cname VARCHAR(22) NOT NULL,
+> cdescp VARCHAR(25) NOT NULL,
+> cred INT,
+> clabfee NUMERIC(5,2),
+> cdept VARCHAR(4) NOT NULL,
+> PRIMARY KEY (cno)
+>) ;

--- SQL Operation complete.
```

To run only the commands in the insert section, execute the following:

```
SQL> OBEY C:\Command Interfaces\course.sql (insert)

SQL> ?section insert
SQL> INSERT INTO course VALUES
+> ('C11', 'Intro to CS','For Rookies',3, 100, 'CIS');

--- 1 row(s) inserted.

SQL> INSERT INTO course VALUES
+> ('C22', 'Data Structures','Very Useful',3, 50, 'CIS');

--- 1 row(s) inserted.

SQL> INSERT INTO course VALUES
+> ('C33', 'Discrete Mathematics', 'Absolutely Necessary',3, 0, 'CIS');

--- 1 row(s) inserted.
```

- This command executes all files with `.sql` extension:

```
SQL> OBEY c:\trafci\.sql;  
SQL> OBEY c:\trafci
```

- This command executes all files beginning with the word `"script"` and contains one character after the word `script` and ends with `.sql` extension. For example: `script1.sql`, `script2.sql`, `scriptZ.sql` and so on.

```
SQL> OBEY C:\trafci\script?.sql
```

- This command executes all files that contain the word `"test"`. This includes the files that do not end with `.sql` extension.

```
SQL> OBEY C:\trafci\test
```

- This command executes all files that begin with the word `"script"` and contains one character after the word `"script"` and ends with an extension prefixed by a dot. For example: `script1.sql`, `script2.bat`, `scriptZ.txt`, and so on.

```
SQL> OBEY C:\trafci\script?.
```

- This command executes all files that have `.txt` extension in the current directory, the directory in which the command interface was launched.

```
SQL> OBEY .txt;
```

- This command prompts the user to enter the script filename or a pattern. The default value is `*.sql`.

```
SQL> OBEY;  
  
Enter the script filename [.sql]:
```

8.21. PRUN Command

The `PRUN` command runs script files in parallel.

8.21.1. Syntax

```
PRUN { -d | -defaults }

PRUN
[ { -sd | -scriptsdir } scriptsdirectory ]
[ { -e | -extension } filedirectory ]
[ { -ld | -logsdir } log-directory ]
[ { -o | -overwrite } {Y | N} ]
[ { -c | -connections } num ]
```

- `-d | -defaults`

Specify this option to have `PRUN` use these default settings:

Parameter	Default Setting
<code>-sd -scriptsdir</code>	<code>PRUN</code> searches for the script files in the same directory as the <code>trafci.sh</code> or <code>trafci.cmd</code> file (<i>trafci-installation-directory/trafci/bin</i> or <i>trafci-installation-directory\trafci\bin</i>).
<code>-e -extension</code>	The file extension is <code>.sql</code> .
<code>-ld -logsdir</code>	<code>PRUN</code> places the log files in the same directory as the script files.
<code>-o -overwrite</code>	No overwriting occurs. <code>PRUN</code> keeps the original information in the log files and appends new information at the end of each file.
<code>-c -connections</code>	<code>PRUN</code> uses two connections.

- `{-sd | -scriptsdir} scripts-directory`

In this directory, `PRUN` processes every file with the specified file extension. If you do not specify a directory or if you specify an invalid directory, an error message occurs, and you are prompted to reenter the directory. Before running `PRUN`, verify that this directory contains valid script files.

- `{-e | -extension} file-extension`

Specify the file extension of the script files. The default is `.sql`.

- `{-ld | -logsdir} log-directory`

In this directory, `PRUN` creates a log file for each script file by appending the `.log` extension to the name of the script file. If you do not specify a log file directory, `PRUN` places the log files in the same directory as the script files.

- `{-o | -overwrite} {y | n}`

If you specify `y`, `PRUN` overwrites the contents of existing log files. By default, `PRUN` keeps the original information in the log files and appends new information at the end of each file.

- `{-c | -connections} num`

Enter a number for the maximum number of connections. If you do not specify the maximum number of connections, `PRUN` uses two connections.

8.21.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- If you execute the `PRUN` command without any arguments, then TrafCI prompts you for the `PRUN` arguments. If you specify one or more options, then the `PRUN` command runs without prompting you for more input. In the non-interactive mode, if any options are not specified, `PRUN` uses the default values.
- The `-d` or `-defaults` option cannot be specified with any other option.
- The `PRUN` log files also contain the log end time.
- `PRUN` does not support the `SPOOL` or `LOG` commands. Those commands are ignored in `PRUN` script files.
- The environment values from the main session (which are available through the `SET` commands) are propagated to new sessions started via `PRUN`. However, prepared statements and parameters are bound only to the main user session.
- For a summary of all errors and warnings that occurred during the `PRUN` operation, go to the error subdirectory in the same directory as the log files (for example, `C:\log\error`) and open the `prun.err.log` summary file.
- For details about the errors that occurred during the execution of a script file, open each individual log file (`script-file.sql.log`).

8.21.3. Examples

- To use `PRUN`, enter the `PRUN` command in the TrafCI session:

```
SQL> PRUN
```

```
Enter  as input to stop the current prun session
-----
Enter the scripts directory           : c:\ddl_scripts
Enter the script file extension[sql]  :
Enter the logs directory[scripts dir] : c:\log
Overwrite the log files (y/n)[n]?     : y
Enter the number of connections(2-248)[2]: 3
```

After you enter the number of connections, `PRUN` starts to process the script files and displays this status:

```
Status: In Progress.....
```

After executing all the script files, PRUN returns a summary of the operation:

```

      _____
      | PARALLELRUN(PRUN)  SUMMARY |
      |_____|
Total files present..... 3
Total files processed..... 3
Total queries processed..... 40
Total errors..... 4
Total warnings..... 0
Total successes..... 36
Total connections..... 5
Total connection failures..... 0

Please verify the error log file c:\log\error\prun.err.log

SQL>
```

In the PRUN summary, the Total queries processed is the total number of commands that PRUN processes. Those commands can include SQL statements and commands. The total errors, warnings, and successes also include commands other than SQL statements.

- This PRUN command initiates a parallel run operation with the `-d` option:

```
SQL> PRUN -d
SQL> PRUN -scriptsdire ./prun/sql -e sql -ld ./prun/logs -o y -connections 5

PRUN options are -scriptsdire    c:/_trafci/prun
                  -logsdire      c:/_trafci/prun/logs
                  -extension     sql
                  -overwrite      y
                  -connections    5

Status: Complete
```

PARALLELRUN(PRUN) SUMMARY	
Total files present.....	99
Total files processed.....	99
Total queries processed.....	198
Total errors.....	0
Total warnings.....	0
Total warnings.....	0
Total connections.....	5
Total connection failures.....	0

```
=====
PRUN completed at May 20, 2105 9:33:21 AM
=====
```

- PRUN can be started in non-interactive mode using the `-q` parameter of `trafci.cmd` or `trafci.sh`, thus requiring no input:

```
trafci.cmd -h 16.123.456.78
-u user1 -p host1
-q "PRUN -sd c:/_trafci/prun -o y -c 3"
```

- PRUN can be started in non-interactive mode from an OBEY file:

```
SQL> OBEY startPrun.txt
SQL> PRUN -sd c:/_trafci/prun -ld c:/_trafci/prun/logs -e sql -o y -c 5

PRUN options are -scriptsdire  c:/_trafci/prun
                  -logsdire   c:/_trafci/prun/logs
                  -extension  sql
                  -overwrite  yes
                  -connections 5
Status: Complete
```

8.22. QUIT Command

The `QUIT` command disconnects from and exits TrafCI.

8.22.1. Syntax

```
QUIT [WITH] [status] [IF {condition}]
```

- *status*

is any 1-byte integer. *status* is a shell return value, and the range of allowable values is platform dependent.

- *condition*

is the same as the condition parameter defined for the [IF...THEN Command](#). See [Condition Parameters](#).

8.22.2. Considerations

You must enter the command on one line. The command does not require an SQL terminator.

8.22.3. Examples

- This command disconnects from and exits TrafCI, which disappears from the screen:

```
SQL> QUIT
```

- In a script file, the conditional exit command causes the script file to quit running and disconnect from and exit TrafCI when the previously run command returns error code 4082:

```
SQL> LOG c:\errorCode.log
SQL> SELECT * FROM employee;
SQL> QUIT IF errorcode=4082
SQL> LOG OFF
```

These results are logged when error code 4082 occurs:

```
SQL> SELECT * FROM employee;
```

```
**** ERROR[4082] Table, view or stored procedure TRAFODION.USR.EMPLOYEE does not  
exist or is inaccessible.
```

```
SQL> QUIT IF errorcode=4082
```

8.23. RECONNECT Command

The `RECONNECT` command creates a new connection to the Trafodion database using the login credentials of the last successful connection.

8.23.1. Syntax

```
RECONNECT
```

8.23.2. Considerations

The host name (or IP address) and port number, plus the credentials (user name and password), are used from information previously entered. This is the information specified at launch or when the last `CONNECT` command was executed.

If TrafCI was invoked with the `-noconnect` launch parameter, TrafCI prompts you for the values.

8.23.3. Examples

- This command creates a new connection to the Trafodion database using the login credentials of the last successful connection:

```
SQL> RECONNECT
```

```
Connected to Trafodion
```

8.24. REPEAT Command

The `REPEAT` command re-executes a previous command.

8.24.1. Syntax

```
REPEAT [text | [-]number ]
```

- *text*

specifies the text of the most recently executed command. The command must have been executed beginning with *text*, but *text* need be only as many characters as necessary to identify the command. TrafCI ignores leading blanks.

- *number*

is an integer that identifies a command in the history buffer. If *number* is negative, it indicates the position of the command in the history buffer relative to the current command; if *number* is positive, it is the ordinal number of a command in the history buffer.

The `HISTORY` command displays the commands or statements in the history buffer. See the [HISTORY Command](#).

8.25. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- To re-execute the immediately preceding command, enter `REPEAT` without specifying a number. If you enter more than one command on a line, then the `REPEAT` command re-executes only the last command on the line.
- When a command is selected for repeat, and the SQL terminator value has changed since the execution of that command, then TrafCI replaces the SQL terminator in the command with the current SQL terminator value and executes the command.

8.25.1. Examples

- Display the previously executed commands and re-execute the second to the last command:

```
SQL> HISTORY
```

```
1> SET IDLETIMEOUT 0
2> LOG ON
3> SET SCHEMA persnl;
4> SELECT * FROM employee;
5> SHOW TABLES
6> SELECT * FROM dept;
7> SHOW VIEWS
8> SELECT * FROM emplist;
```

```
SQL>
```

```
SQL> REPEAT -2
```

```
SHOW VIEWS
```

```
VIEW NAMES
```

```
-----
EMPLIST  MGRLIST
```

```
SQL>
```

- Re-execute the fifth command in the history buffer:

```
SQL> REPEAT 5

SHOW TABLES
TABLE NAMES
-----
DEPT      EMPLOYEE  JOB        PROJECT
SQL>
```

- Re-execute the `SHOW TABLES` command:

```
SQL> REPEAT SHOW

SHOW TABLES
TABLE NAMES
-----
DEPT      EMPLOYEE  JOB        PROJECT
SQL>
```

8.26. RESET LASTERROR Command

The `RESET LASTERROR` command resets the last error code to 0.

8.26.1. Syntax

```
RESET LASTERROR
```

8.26.2. Considerations

You must enter the command on one line. The command does not require an SQL terminator.

8.26.3. Examples

- This command resets the last error in the current session:

```
SQL> SELECT * FROM emp;

**** ERROR[4082]Object TRAFODION.SCH.EMP does not exist or is inaccessible.

SQL> SHOW LASTERROR

LASTERROR 4082

SQL> RESET LASTERROR
SQL> SHOW LASTERROR

LASTERROR 0
```

8.27. RESET PARAM Command

The RESET PARAM command clears all parameter values or a specified parameter value in the current session.

8.27.1. Syntax

```
RESET PARAM [param-name]
```

- *param-name*

is the name of the parameter for which you specified a value. Parameter names are case-sensitive. For example, the parameter ?pn is not equivalent to the parameter ?PN. *param-name* can be preceded by a question mark (?), such as ?*param-name*.

If you do not specify a parameter name, all of the parameter values in the current session are cleared.

8.27.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- To clear several parameter values but not all, you must use a separate RESET PARAM command for each parameter.

8.27.3. Example

- This command clears the setting of the ?sal (salary) parameter, and the SET PARAM command resets it to a new value:

```
SQL> RESET PARAM ?sal +  
SQL> SET PARAM ?sal 80000.00
```

For more information, see [Reset the Parameters](#).

8.28. RUN Command

The `RUN` command executes the previously executed SQL statement. This command does not repeat an interface command.

8.28.1. Syntax

```
RUN
```

8.28.2. Considerations

- You must enter the command on one line.
- The command does not require an SQL terminator.

8.28.3. Example

- This command executes the previously executed `SELECT` statement:

```
SQL> SELECT COUNT(*) FROM persnl.employee;

(Expr)
-----
62

--- 1 row(s) selected.

SQL> RUN

(Expr)
-----
62

--- 1 row(s) selected.

SQL>
```

8.29. SAVEHIST Command

The `SAVEHIST` command saves the session history in a user-specified file. The session history consists of a list of the commands that were executed in the TrafCI session before the `SAVEHIST` command.

8.29.1. Syntax

```
SAVEHIST file-name [CLEAR]
```

- *file-name*

is the name of a file into which TrafCI stores the session history. If you want the history file to exist outside the local directory where you launch TrafCI (by default, the `bin` directory), specify the full directory path of the history file. The specified directory must exist before you execute the `SAVEHIST` command.

- `CLEAR`

instructs TrafCI to clear the contents of the specified file before adding the session history to the file.

8.29.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- If the specified file already exists, TrafCI appends newer session-history information to the file.

8.29.3. Examples

- This command clears the contents of an existing file named `history.txt` in the local directory (the same directory where you are running TrafCI) and saves the session history in the file:

```
SQL> SAVEHIST history.txt CLEAR
SQL>
```

- This command saves the session history in a file named `hist.txt` in the specified directory on a Windows workstation:

```
SQL> SAVEHIST c:\log_files\hist.txt
SQL>
```

- This command saves the session history in a file named `hist.txt` in the specified directory on a Linux or UNIX workstation:

```
SQL> SAVEHIST ./log_files/hist.txt
SQL>
```

For more information, see [Display Executed Commands](#).

8.30. SET COLSEP Command

The `SET COLSEP` command sets the column separator and allows you to control the formatting of the result displayed for SQL queries. The `SET COLSEP` command specifies a delimiter value to use for separating columns in each row of the results. The default delimiter is " "(white space).

8.30.1. Syntax

```
SET COLSEP [separator]
```

8.30.2. Considerations

- You must enter the command on one line.
- The `SET COLSEP` command has no effect if the markup is set to `HTML`, `XML`, or `CSV`.

8.30.3. Examples

- This command specifies the separator as a "|" (pipe):

```
SQL> SET COLSEP |
SQL> SHOW COLSEP
COLSEP " | "
SQL> SELECT * FROM employee;
```

EMPNUM	EMPNAME	REGNUM	BRANCHNUM	JOB
1	ROGER GREEN	99	1	MANAGER
23	JERRY HOWARD	2	1	MANAGER
29	JACK RAYMOND	1	1	MANAGER
32	THOMAS RUDLOFF	5	3	MANAGER
39	KLAUS SAFFERT	5	2	MANAGER

```
--- 5 row(s) selected.
```

8.31. SET FETCHSIZE Command

The `SET FETCHSIZE` command allows you to change the default fetchsize used by JDBC. Setting the value to 0 sets the fetchsize to the default value used in JDBC.

8.31.1. Syntax

```
SET FETCHSIZE _value_
```

- *value*

is an integer representing the fetch size as a number of rows. Zero (0) represents the default value of fetch size set in JDBC.

8.31.2. Considerations

- You must enter the command on one line.
- The command does not require an SQL terminator.

8.31.3. Examples

- This command sets the fetchsize to 1:

```
SQL> SET FETCHSIZE 1
SQL> SHOW FETCHSIZE

FETCHSIZE 1

SQL> SELECT * FROM stream(t1);

C1          C2          C3
-----
TEST1      TEST2      TEST3
AAA        BBB        CCC
```

8.32. SET HISTOPT Command

The `SET HISTOPT` command sets the history option and controls how commands are added to the history buffer. By default, commands within a script file are not added to history. If the history option is set to `ALL`, then all the commands in the script file are added to the history buffer. If no options are specified, `DEFAULT` is used.

8.32.1. Syntax

```
SET HISTOPT [ ALL | DEFAULT ]
```

8.32.2. Considerations

You must enter the command on one line.

8.32.3. Examples

- This command shows only the obey commands added to the history buffer.

```
SQL> SHOW HISTOPT

HISTOPT DEFAULT [No expansion of script files]

SQL> OBEY e:\scripts\nobey\insert2.sql

SQL> ?SECTION insert

SQL> SET SCHEMA trafodion.sch;

--- SQL operation complete.

SQL> INSERT INTO course1 VALUES
+> ('C11', 'Intro to CS','For Rookies',3, 100,'CIS');

--- 1 row(s) inserted.

SQL> INSERT INTO course1 VALUES
+> ('C55', 'Computer Arch.','VON Neumann''S Mach.',3, 100, 'CIS');

--- 1 row(s) inserted.
```

```
SQL> HISTORY;

1> SHOW HISTOPT
2> OBEY e:\scripts\nobey\insert2.sql
```

- This command shows all the commands added to the history buffer.

```
SQL> SET HISTOPT ALL
SQL> OBEY e:\scripts\nobey\insert2.sql

?SECTION insert

SQL> set schema trafodion.sch;

--- SQL operation complete.

SQL> INSERT INTO course1 VALUES
+> ('C11','Intro to CS','For Rookies',3, 100, 'CIS');

---1 row(s) inserted.

SQL> INSERT INTO course1 VALUES
+> ('C55','Computer Arch.','Von Neumann''s Mach.',3,100, 'CIS');

---1 row(s) inserted.

SQL> HISTORY;

1> SHOW HISTOPT
2> OBEY e:\scripts\nobey\insert2.sql
3> HISTORY;
4> SET HISTOPT ALL
5> SET SCHEMA trafodion.sch;
6> INSERT INTO course1 VALUES
    ('C11','Intro to CS','For Rookies',3, 100, 'CIS');
7> INSERT INTO course1 VALUES
    ('C55','Computer Arch.','Von Neumann''s MACH.',3,100, 'CIS');
```

8.33. SET IDLETIMEOUT Command

The `SET IDLETIMEOUT` command sets the idle timeout value for the current session. The idle timeout value of a session determines when the session expires after a period of inactivity. The default is 30 `minutes`.

8.33.1. Syntax

```
SET IDLETIMEOUT value
```

- *value*

is an integer representing the idle timeout value in minutes. Zero represents an infinite amount of time, meaning that the session never expires.

8.33.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- If you execute this command in a script file, it affects the session in which the script file runs. You can specify this command in `PRUN` script files. However, running this command from a `PRUN` script file does not affect the idle timeout value for the current session.
- To reset the default timeout value, enter this command:

```
SET IDLETIMEOUT 30
```

8.33.3. Examples

- This command sets the idle timeout value to four hours:

```
SQL> SET IDLETIMEOUT 240
```

- This command sets the idle timeout value to an infinite amount of time so that the session never expires:

```
SQL> SET IDLETIMEOUT 0
```

- To reset the idle timeout to the default, enter this command:

```
SQL> SET IDLETIMEOUT 30
SQL>
```

For more information, see [Set and Show Session Idle Timeout Value](#).

8.34. SET LIST_COUNT Command

The `SET LIST_COUNT` command sets the maximum number of rows to be returned by `SELECT` statements that are executed after this command. The default is zero, which means that all rows are returned.

8.34.1. Syntax

```
SET LIST_COUNT num-rows
```

- *num-rows*

is a positive integer that specifies the maximum number of rows of data to be displayed by `SELECT` statements that are executed after this command. Zero means that all rows of data are returned.

8.34.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- To reset the number of displayed rows, enter this command:

```
SET LIST_COUNT 0
```

8.34.3. Examples

- This command specifies that the number of rows to be displayed by `SELECT` statements is five:

```
SQL> SET LIST_count 5
SQL> SELECT empnum, first_name, last_name FROM persnl.employee ORDER BY empnum;
```

EMPNUM	FIRST_NAME	LAST_NAME
1	ROGER	GREEN
23	JERRY	HOWARD
29	JANE	RAYMOND
32	THOMAS	RUDLOFF
39	KLAUS	SAFFERT

```

--- 5 row(s) selected. LIST_COUNT was reached.

SQL>
```

- This command resets the number of displayed rows to all rows:

```
SQL> SET LIST_COUNT 0
SQL> SELECT empnum, first_name, last_name
+> FROM persnl.employee
+> ORDER BY empnum;
```

EMPNUM	FIRST_NAME	LAST_NAME
1	ROGER	GREEN
23	JERRY	HOWARD
29	JANE	RAYMOND
32	THOMAS	RUDLOFF
39	KLAUS	SAFFERT
43	PAUL	WINTER
65	RACHEL	MCKAY
...		
995	Walt	Farley

```
--- 62 row(s) selected.
```

```
SQL>
```

8.35. SET MARKUP Command

The `SET MARKUP` command sets the markup format and controls how results are displayed by TrafCI.

8.35.1. Syntax

```
SET MARKUP [ RAW | HTML | XML | CSV | COLSEP ]
```

The supported options enable results to be displayed in XML, HTML, CSV (Comma Separated Values), and COLSEP format.

The default format is `RAW`.

8.35.2. Considerations

- You must enter the command on one line.
- If the `MARKUP` format is `CSV` or `COLSEP`, the column header information and status messages are not displayed.
- For the `XML` and `HTML` markup format, the syntax and interface errors is consistent XML and HTML markup is displayed.
- For `XML` markup, any occurrence of `]]>` that appear in the error message or invalid query are replaced with `]]>`.
- When error messages are output as `HTML` markup, both the `>` (greater than) and `<` (less than) symbols are replaced with their escaped versions: `>` and `<`, respectively. An example of the formatted error messages are show below.

8.35.3. Examples

- This command specifies results be displayed in HTML:

```
SQL> SET MARKUP HTML
SQL> SELECT c.custnum, c.custnum, ordernum, order_date
+> FROM customer c, orders o where c.custnum=o.custnum;

<TABLE>
<!--SELECT c.custnum, c.custname,ordernum,order_date
FROM customer c, orders o where c.custnum=o.custnum;-->
<tr>
  <th>CUSTNUM</th>
  <th>CUSTNAME</th>
  <th>ORDERNUM</th>
  <th>ORDER_DATE</th>
</tr>
<tr>
  <td>143</td>
  <td>STEVENS SUPPLY</td>
  <td>700510</td>
  <td>2105-05-01</td>
</tr>
<tr>
  <td>3333</td>
  <td>NATIONAL UTILITIES</td>
  <td>600480</td>
  <td>2105-05-12</td>
</tr>
<tr>
  <td>7777</td>
  <td>SLEEP WELL HOTELS</td>
  <td>100250</td>
  <td>2105-01-23</td>
</tr>
<!-- --- 3 row(s) selected.-->
</TABLE>
```

```
SQL> SELECT c.custnum, c.custname,ordernum,order_date,
+> FROM customer c, orders o where c.custnum=o.custnum;

<TABLE>
<!-- SELECT c.custnum, c.custname,ordernum,order_date,
FROM customer c, orders o where c.custnum=o.custnum;-->
<tr>
  <th>Error Id</th>
  <th>Error Code</th>
  <th>Error Message</th>
</tr>
<tr>
  <td>1</td>
  <td>4082</td>
  <td>Object TRAFODION.NVS.CUSTOMER does not exist or is inaccessible.</td>
</tr>
</TABLE>
```

- To set the application to format output as HTML:

```
SQL> SET MARKUP HTML
```

HTML formatted error message example:

```
SQL> SET MARKUP <invalid>

<?xml version="1.0"?>
<Results>
  <Query>
    <![CDATA[set markup <invalid >>]]>
  </Query>
  <ErrorList>
    <Error id="1">
      <ErrorCode>NVC1001</ErrorCode>
      <ErrorMsg> <![CDATA[
ERROR: A syntax error occurred at or before:
set markup <invalid>
      ^ ]]
    </ErrorMsg>
  </ErrorList>
</Results>
```

- This command specifies results be displayed in CSV:

```
SQL> SET MARKUP CSV
SQL> SELECT c.custnum, c.custnum, ordernum, order_date
+> FROM customer c,orders o where c.custnum=o.custnum;

143,STEVENS SUPPLY ,700510,2105-05-01
3333,NATIONAL UTILITIES,600480,2105-05-12
7777,SLEEPWELL HOTELS ,100250,2105-01-23
324,PREMIER INSURANCE ,500450,2105-04-20
926,METALL-AG. ,200300,2105-02-06
123,BROWN MEDICAL CO ,200490,2105-03-19
123,BROWN MEDICAL CO ,300380,2105-03-19
543,FRESNO STATE BANK ,300350,2105-03-03
5635,ROYAL CHEMICALS ,101220,2105-05-21
21,CENTRAL UNIVERSITY,200320,2105-02-17
1234,DATASPEED ,100210,2105-04-10
3210,BESTFOOD MARKETS ,800660,2105-05-09
```

- This command specifies results be displayed in XML:

```
SQL> SET MARKUP XML
SQL> SELECT * FROM author

<?xml version="1.0"?>
<Results>
  <Query>
    <![CDATA[select  from author;]]>
  </Query>
  <rowid="1">
    <AUTHORID>91111</AUTHORID>
    <AUTHORNAME>Bjarne Stroustrup</AUTHORNAME>
  </row>
  <rowid="2">
    <AUTHORID>444444</AUTHORID>
    <AUTHORNAME>John Steinbeck</AUTHORNAME>
  </row>
  <rowid="3">
    <AUTHORID>2323423</AUTHORID>
    <AUTHORNAME>Irwin Shaw</AUTHORNAME>
  </row>
  <rowid="4">
    <AUTHORID>93333</AUTHORID>
    <AUTHORNAME>Martin Fowler</AUTHORNAME>
  </row>
  <rowid="5">
    <AUTHORID>92222</AUTHORID>
    <AUTHORNAME>Grady Booch</AUTHORNAME>
  </row>
  <rowid="6">
    <AUTHORID>84758345</AUTHORID>
    <AUTHORNAME>Judy Blume</AUTHORNAME>
  </row>
  <rowid="7">
    <AUTHORID>89832473</AUTHORID>
    <AUTHORNAME>Barbara Kingsolver</AUTHORNAME>
  </row>
  <Status> <![CDATA[-- 7 row(s) selected .]]></Status>
</Results>
```

- To set the application to format output as XML:

```
SQL> SET MARKUP XML
```

XML formatted error message examples:

```
SQL> SET MARKUP <]]>

<?xml version="1.0"?>
<Results>
  <Query>
    <![CDATA[set markup <]]&#62; ]]>>
  </Query>
  <ErrorList>
    <Error id="1">
      <ErrorCode>UNKNOWN ERROR CODE</ErrorCode>
      <ErrorMessage> <![CDATA[
ERROR: A syntax error occurred at or before:
set markup <]]&#62;]>
          ^ ]]<>
      </ErrorMessage>
    </ErrorList>
  </Results>
```

- This command displays CSV like output using the COLSEP value as a separator.

```
SQL> SET COLSEP |
SQL> SET MARKUP COLSEP
SQL> SELECT * FROM employee;

32|THOMAS      |RUDLOFF      |2000|100|138000.40
39|KLAUS       |SAFFERT      |3200|100|75000.00
89|PETER       |SMITH        |3300|300|37000.40
29|JANE        |RAYMOND      |3000|100|136000.00
65|RACHEL      |MCKAY        |4000|100|118000.00
75|TIM         |WALKER       |3000|300|320000.00
11|ROGER       |GREEN        |9000|100|175500.00
93|DONALD      |TAYLOR       |3100|300|33000.00
```

8.36. SET PARAM Command

The `SET PARAM` command associates a parameter name with a parameter value in the current session. The parameter name and value are associated with one of these parameter types:

- Named parameter (represented by `?param-name`) in a DML statement or in a prepared SQL statement
- Unnamed parameter (represented by `?`) in a prepared SQL statement only

A prepared statement is one that you SQL compile by using the `PREPARE` statement. For more information about `PREPARE`, see the [Trafodion SQL Reference Manual](#).

After running `SET PARAM` commands in the session:

- You can specify named parameters (`?param-name`) in a DML statement.
- You can execute a prepared statement with named parameters by using the `EXECUTE` statement without a `USING` clause.
- You can execute a prepared statement with unnamed parameters by using the `EXECUTE` statement with a `USING` clause that contains literal values and/or a list of the named parameters set by `SET PARAM`.

The `EXECUTE` statement substitutes parameter values for the parameters in the prepared statement. For more information about `EXECUTE`, see the [Trafodion SQL Reference Manual](#).

8.36.1. Syntax

```
SET PARAM param-name [UTF8] param-value
```

- *param-name*

is the name of the parameter for which a value is specified. Parameter names are case-sensitive. For example, the parameter `?pn` is not equivalent to the parameter `?PN`. *param-name* can be preceded by a question mark (`?`), such as `?param-name`.

- UTF8

specifies that a character string specified for the parameter value, *param-value*, uses the UTF8 character set. If the character string is in UTF8 format, it must be prefixed by UTF8.

- *param-value*

is a numeric or character literal that specifies the value for the parameter. If you do not specify a value, TrafCI returns an error.

If *param-value* is a character literal and the target column type is a character string, you do not have to enclose the value in single quotation marks. Its data type is determined from the data type of the column to which the literal is assigned. Character strings specified as parameter values are always case-sensitive even if they are not enclosed in quotation marks. If the character string is in UTF8 format, it must be prefixed by UTF8.

8.36.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- Use separate `SET PARAM` commands to name and assign values to each unique parameter in a prepared SQL statement before running the `EXECUTE` statement.
- Parameter names are case-sensitive. If you specify a parameter name in lowercase in the `SET PARAM` command, you must specify it in lowercase in other statements, such as DML statements or `EXECUTE`.
- The name of a named parameter (`?param-name`) in a DML statement must be identical to the parameter name (*param-name*) that you specify in a `SET PARAM` command.

8.36.3. Examples

- This command sets a value for the `?sal` (salary) parameter:

```
SQL> SET PARAM ?sal 40000.00
```

- This command sets a character string value, `GREEN`, for the `?lastname` parameter:

```
SQL> SET PARAM ?lastname GREEN
```

- These commands set values for named parameters in a subsequent `SELECT` statement:

```
SQL> SET PARAM ?sal 80000.00
SQL> SET PARAM ?job 100
SQL> SELECT * FROM persnl.employee WHERE salary = ?sal AND jobcode = ?job;
```

EMPNUM	FIRST_NAME	LAST_NAME	DEPTNUM	JOBCODE	SALARY
72	GLENN	THOMAS	3300	100	80000.00

```

--- 1 row(s) selected.

SQL>
```

The names of the named parameters, `?sal` and `?job`, in the `SELECT` statement are identical to the parameter names, `sal` and `job`, in the `SET PARAM` command.

- This command sets a character string value, `Peña`, which is in UTF8 format, for the `?lastname` parameter:

```
SQL> SET PARAM ?lastname UTF8'Pe&#241;a'
```

- This command sets a character string value, which uses the UTF8 character set and is in hexadecimal notation, for the `?lastname` parameter:

```
SQL> SET PARAM ?lastname UTF8x'5065266e74696c64653b61'
```

For more information, see [Set Parameters](#).

8.37. SET PROMPT Command

The `SET PROMPT` command sets the prompt of the current session to a specified string and/or to the session variables, which start with `%`. The default prompt is `SQL>`.

8.37.1. Syntax

```
SET PROMPT [string] [%USER] [%SERVER] [%SCHEMA]
```

- *string*

is a string value to be displayed as the prompt. The string may contain any characters. Spaces are allowed if you enclose the string in double quotes (`"`). If you do not enclose the string in double quotes, the prompt is displayed in uppercase.

- `%USER`

displays the session user name as the prompt.

- `%SERVER`

displays the session host name and port number as the prompt.

- `%SCHEMA`

displays the session schema as the prompt.

8.37.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- To reset the default prompt, enter this command:

```
SET PROMPT
```

8.37.3. Examples

- This `SET PROMPT` command sets the SQL prompt to `ENTER>`:

```
SQL> SET PROMPT Enter>
ENTER>
```

- To reset the SQL prompt to the default, enter this `SET PROMPT` command:

```
ENTER> SET PROMPT +
SQL>
```

- This command displays the session user name for the prompt:

```
SQL> SET PROMPT %user>
user1>
```

- This command displays the session host name and port number for the prompt:

```
SQL> SET PROMPT %server>
sqws135.houston.host.com:22900>
```

- This command displays the session schema for the prompt:

```
SQL> SET PROMPT "Schema %schema:"
Schema USR:
```

- This command displays multiple session variables:

```
SQL> SET PROMPT %USER%@%SCHEMA> user1@USR>
user1@USR>set prompt %SERVER:%USER>
sqws135.houston.host.com:22900:user1>
sqws135.houston.host.com:22900:user1> SET PROMPT "%schema CI> "
USR CI>
```

For more information, see [Customize Standard Prompt](#).

8.38. SET SQLPROMPT Command

The `SET SQLPROMPT` command sets the SQL prompt of the current session to a specified string. The default is `SQL>`.

8.38.1. Syntax

```
SET SQLPROMPT [string] [%USER] [%SERVER] [%SCHEMA]
```

- *string*

is a string value to be displayed as the SQL prompt. The string may contain any characters. Spaces are allowed if you enclose the string in double quotes ("). If you do not enclose the string in double quotes ("), the prompt is displayed in uppercase.

- %USER

displays the session user name as the prompt.

- %SERVER

displays the session host name and port number as the prompt.

- %SCHEMA

displays the session schema as the prompt.

8.38.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- To reset the default SQL prompt, enter this command:

```
SET SQLPROMPT
```

8.38.3. Examples

- This command sets the SQL prompt to ENTER>:

```
SQL> SET SQLPROMPT Enter>
ENTER>
```

- To reset the SQL prompt to the default, enter this command:

```
ENTER> SET SQLPROMPT
SQL>
```

- This command displays the session user name for the prompt:

```
SQL> SET SQLPROMPT %user>
user1>
```

- This command displays the session host name and port number for the prompt:

```
SQL> SET SQLPROMPT %server>
sqws135.houston.host.com:22900>
```

- This command displays the session schema for the prompt:

```
SQL> SET SQLPROMPT "Schema %schema: "
Schema USR:
```

- This command displays multiple session variables:

```
SQL> SET SQLPROMPT %USER@%SCHEMA>
user1@USR>

SQL> SET SQLPROMPT %SERVER:%USER>
sqws135.houston.host.com:22900:user1>
sqws135.houston.host.com:22900:user1> SET SQLPROMPT "%schema CI> "
USR CI>
```

For more information, see [Customize Standard Prompt](#).

8.39. SET SQLTERMINATOR Command

The `SET SQLTERMINATOR` command sets the SQL statement terminator of the current session. The default is a semicolon (;).

8.39.1. Syntax

```
SET SQLTERMINATOR string
```

- *string*

is a string value for the SQL terminator. The string may contain any characters except spaces. Spaces are disallowed even if you enclose the string in double quotes. Lowercase and uppercase characters are accepted, but the SQL terminator is always shown in uppercase.

8.39.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- Do not include a reserved word as an SQL terminator.
- If you execute this command in a script file, it affects not only the SQL statements in the script file but all subsequent SQL statements that are run in the current session. If you set the SQL terminator in a script file, reset the default terminator at the end of the script file.
- To reset the default SQL terminator (;), enter this command:

```
SET SQLTERMINATOR ;
```

8.39.3. Examples

- This command sets the SQL terminator to a period (.):

```
SQL> SET SQLTERMINATOR .
```

- This command sets the SQL terminator to a word, go:

```
SQL> SET SQLTERMINATOR go
```

This query ends with the new terminator, go:

```
SQL> SELECT * FROM persnl.employee go
```

- To reset the SQL terminator to the default, enter this command:

```
SQL> SET SQLTERMINATOR ;
```

For more information, [Set and Show the SQL Terminator](#).

8.40. SET STATISTICS Command

The `SET STATISTICS` command automatically retrieves the statistics information for a query being executed. The results returned are the same as would have been returned if the `GET STATISTICS` command was executed. The default is `OFF` which means the statistics information is not automatically printed for any queries.

8.40.1. Syntax

```
SET STATISTICS { ON | OFF }
```

8.40.2. Considerations

You must enter the command on one line.

8.40.3. Examples

- This command shows the default output format as PERTABLE:

```
SQL> SET STATISTICS ON
SQL> SELECT * FROM job;
```

JOBCODE	JOBDESC
100	MANAGER
450	PROGRAMMER
900	SECRETARY
300	SALESREP
500	ACCOUNTANT
400	SYSTEM ANALYST
250	ASSEMBLER
420	ENGINEER
600	ADMINISTRATOR
200	PRODUCTION SUPV

--- 11 row(s) selected.

```
Start Time          2105/05/18 21:45:34.082329
End Time            2105/05/18 21:45:34.300265
Elapsed Time        00:00:00.217936
Compile Time        00:00:00.002423
Execution Time      00:00:00.218750
```

Table Name	Records Accessed	Records Used	Disk I/Os	Message Count	Message Bytes	Lock Escl	Lock Wait	Disk Busy	Process Time
TRAFODION.TOI.JOB	2	2	0	4	15232	0	0		363

```
SQL>
```

For more information on the STATISTICS command, see the [Trafodion SQL Reference Manual](#).

8.41. SET TIME Command

The `SET TIME` command causes the local time of the client workstation to be displayed as part of the interface prompt. By default, the local time is not displayed in the interface prompt.

8.41.1. Syntax

```
SET TIME { ON[12H] | OFF }
```

- ON

specifies that the local time be displayed as part of the prompt.

- OFF

specifies that the local time not be displayed as part of the prompt. `OFF` is the default.

8.41.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- The default is a 24-hour military style display. The additional argument of `12h` allows the time to be displayed in a 12-hour AM/PM style.

8.41.3. Examples

- This command causes the local time to be displayed in the SQL prompt:

```
SQL> SET TIME ON  
14:17:17 SQL>
```

- This command causes the local time to be displayed in 12-hour AM/PM style in the SQL prompt:

```
SQL> SET TIME ON 12H  
2:17:17 PM SQL>
```

- This command turns off the local time in the SQL prompt:

```
2:17:17 PM SQL> SET TIME OFF  
SQL>
```

For more information, see [Customize the Standard Prompt](#).

8.42. SET TIMING Command

The `SET TIMING` command causes the elapsed time to be displayed after each SQL statement executes. This command does not cause the elapsed time of interface commands to be displayed. By default, the elapsed time is `off`.

8.42.1. Syntax

```
SET TIMING { ON | OFF }
```

- `ON`

specifies the elapsed time be displayed after each SQL statement executes.

- `OFF`

specifies that the elapsed time not be displayed after each SQL statement executes. `OFF` is the default.

8.42.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- The elapsed time value includes compile and execution time plus any network I/O time and client-side processing time.

8.42.3. Examples

- This command displays the elapsed time of SQL statements:

```
SQL> SET TIMING ON
```

- This command turns off the elapsed time:

```
SQL> SET TIMING OFF
```

For more information, see [Display the Elapsed Time](#).

8.43. SHOW ACTIVITYCOUNT Command

The `SHOW ACTIVITYCOUNT` command provides an alias for `SHOW RECCOUNT`. `ACTIVITYCOUNT` is an alias for `RECCOUNT`. For more information, see the [SHOW RECCOUNT Command](#).

8.43.1. Syntax

```
SHOW ACTIVITYCOUNT
```

8.43.2. Examples

- This command shows the record count of the previous executed SQL statement:

```
SQL> SHOW ACTIVITYCOUNT  
  
ACTIVITYCOUNT 0
```

8.44. SHOW ALIAS Command

The `SHOW ALIAS` command displays all or a set of aliases available in the current TrafCI session. If a pattern is specified, then all aliases matching the pattern are displayed. By default, all aliases in the current session are displayed.

8.44.1. Syntax

```
SHOW ALIAS [ alias-name | wild-card-pattern ]
```

- *alias-name*

is any alias name that is used with the `ALIAS` command. See [ALIAS Command](#).

- *wild-card-pattern*

is a character string used to search for and display aliases with names that match the character string. *wild-card-pattern* matches an uppercase string unless you enclose it within double quotes. To look for similar values, specify only part of the characters of *wild-card-pattern* combined with these wild-card characters.

%	Use a percent sign (%) to indicate zero or more characters of any type. For example, %art% matches SMART, ARTIFICIAL, and PARTICULAR but not smart or Hearts. "%art%" matches smart and Hearts but not SMART, ARTIFICIAL, or PARTICULAR.
*	Use an asterisk (*) to indicate zero or more characters of any type. For example, *art matches SMART, ARTIFICIAL, and PARTICULAR but not smart or Hearts. " art " matches smart and Hearts but not SMART, ARTIFICIAL, or PARTICULAR.
_	Use an underscore (_) to indicate any single character. For example, boo_ matches BOOK and BOOT but not BOO or BOOTS. "boo_" matches book and boot but not boo or boots.
?	Use a question mark (?) to indicate any single character. For example, boo? matches BOOK and BOOT but not BOO or BOOTS. "boo?" matches book and boot but not boo or boots.

8.44.2. Considerations

You must enter the command on one line. The command does not require an SQL terminator.

8.44.3. Examples

- This command displays a list of the available aliases:

```
SQL> SHOW ALIAS

.OS AS LH
.GOTO AS GOTO
USE AS SET SCHEMA
```

- This command displays the .GOTO alias:

```
SQL> SHOW ALIAS .GOTO

.GOTO AS GOTO
```

- This command displays the .FOO alias:

```
SQL> SHOW ALIAS .FOO

No aliases found.
```

- This command displays all aliases beginning with the letter S:

```
SQL> SHOW ALIAS S*

SEL AS SELECT
SHOWTIME AS SHOW TIME
ST AS SHOW TABLES
```

8.45. SHOW ALIASES Command

The `SHOW ALIASES` command displays all the aliases available in the current TrafCI session.

8.45.1. Syntax

```
SHOW ALIASES
```

8.45.2. Considerations

You must enter the command on one line. The command does not require an SQL terminator.

8.45.3. Examples

- This command displays all the aliases in the current TrafCI session:

```
SQL> SHOW ALIASES

.OS AS LH
.GOTO AS GOTO
USE AS SET SCHEMA
```

8.46. SHOW CATALOG Command

The `SHOW CATALOG` command displays the current catalog of the TrafCI session.

8.46.1. Syntax

```
SHOW CATALOG
```

8.46.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- If the `SET TIMING` command is set to `ON`, the elapsed time information is displayed.

8.46.3. Example

- This command shows that the current catalog of the session is TRAFODION:

```
SQL> SHOW CATALOG  
  
CATALOG TRAFODION
```

8.47. SHOW COLSEP Command

The `SHOW COLSEP` command displays the value of the column separator for the current TrafCI session.

8.47.1. Syntax

```
SHOW COLSEP
```

8.47.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- If the `SET TIMING` command is set to `ON`, the elapsed time information is displayed.

8.47.3. Examples

- This command displays the column separator.

```
SQL> SHOW COLSEP

COLSEP " "

SQL> SET COLSEP
SQL> SHOW COLSEP

COLSEP " "
```

- This command displays the column separator.

```
SQL> SHOW COLSEP

COLSEP " "

SQL> SET COLSEP
SQL> SHOW COLSEP

COLSEP " "
```

8.48. SHOW ERRORCODE Command

The `SHOW ERRORCODE` command is an alias for the `SHOW LASTERROR` command. `ERRORCODE` is an alias for `LASTERROR`. For more information, see [SHOW LASTERROR Command](#).

8.48.1. Syntax

```
SHOW ERRORCODE
```

8.48.2. Examples

- This command displays the error of the last SQL statement that was executed:

```
SQL> SHOW ERRORCODE

ERRORCODE 29481
```

8.49. SHOW FETCHSIZE Command

The `SHOW FETCHSIZE` command displays the fetch size value for the current TrafCI session.

8.49.1. Syntax

```
SHOW FETCHSIZE
```

8.49.2. Considerations

You must enter the command on one line.

8.49.3. Examples

- These commands display the fetch size in the current TrafCI session, set the fetch size to a new value, and then redisplay the fetch size:

```
SQL> SHOW FETCHSIZE

FETCHSIZE 0 [Default]

SQL> SET FETCHSIZE 1
SQL> SHOW FETCHSIZE

FETCHSIZE 1
```

8.50. SHOW HISTOPT Command

The `SHOW HISTOPT` command displays the value that has been set for the history option.

8.50.1. Syntax

```
SHOW HISTOPT
```

8.50.2. Considerations

- You must enter the command on one line.
- If the `SET TIMING` command is set to `ON`, the elapsed time information is displayed.

8.50.3. Examples

- This command displays the value set for the history option:

```
SQL> SHOW HISTOPT

HISTOPT DEFAULT [No expansion of script files]

SQL> SET HISTOPT ALL
SQL> SHOW HISTOPT

HISTOPT ALL
```

8.51. SHOW IDLETIMEOUT Command

The `SHOW IDLETIMEOUT` command displays the idle timeout value of the current TrafCI session. The idle timeout value of a session determines when the session expires after a period of inactivity. The default is 30 `minutes`.

8.51.1. Syntax

```
SHOW IDLETIMEOUT
```

8.51.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- If the `SET TIMING` command is set to `ON`, the elapsed time information is displayed.

8.51.3. Examples

- This command shows that the idle timeout value of the session is 30 minutes, which is the default:

```
SQL> SHOW IDLETIMEOUT  
  
IDLETIMEOUT 30 min(s)  
  
Elapsed time:00:00:00:078
```

- This command shows that the idle timeout value of the session is four hours:

```
SQL> SHOW IDLETIMEOUT  
  
IDLETIMEOUT 240 min(s)
```

- This command shows that the idle timeout value is an infinite amount of time, meaning that the session never expires:

```
SQL> SHOW IDLETIMEOUT  
  
IDLETIMEOUT 0 min(s) [Never Expires]
```

- This command displays the elapsed time information because `SET TIMING` command is enabled:

```
SQL> SET TIMING ON  
SQL> SHOW IDLETIMEOUT  
  
IDLETIMEOUT 0 min(s) [Never Expires]  
  
Elapsed time:00:00:00:078
```

For more information, see [Set and Show Session Idle Timeout Value](#).

8.52. SHOW LASTERROR Command

The `SHOW LASTERROR` command displays the error of the last SQL statement that was executed. If the query was successful, then 0 is returned; otherwise an SQL error code is returned.

8.52.1. Syntax

```
SHOW LASTERROR
```

8.52.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- If the `SET TIMING` command is set to `ON`, the elapsed time information is displayed.

8.52.3. Examples

- This command shows the last error in the current session:

```
SQL> SELECT * FROM emp;  
  
**** ERROR[4082]Object TRAFODION.SCH.EMP does not exist or is inaccessible.  
  
SQL> SHOW LASTERROR  
  
LASTERROR 4082
```

8.53. SHOW LIST_COUNT Command

The `SHOW LIST_COUNT` command displays the maximum number of rows to be returned by `SELECT` statements in the current TrafCI session. The default is `zero`, which means that all rows are returned.

8.53.1. Syntax

```
SHOW LIST_COUNT
```

8.53.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- If the `SET TIMING` command is set to `ON`, the elapsed time information is displayed.

8.53.3. Examples

- This command shows that `SELECT` statements return all rows in the current session:

```
SQL> SHOW LIST_COUNT

LISTCOUNT 0 [All Rows]

Elapsed time:00:00:00:078
```

- This command shows that the maximum number of rows to be displayed by `SELECT` statements in the session is five:

```
SQL> SET LIST_COUNT 5
SQL> SHOW LIST_COUNT

LIST_COUNT 5

Elapsed time:00:00:00:078
```

8.54. SHOW MARKUP Command

The `SHOW MARKUP` command displays the value set for the markup option.

8.54.1. Syntax

```
SHOW MARKUP
```

8.54.2. Considerations

- You must enter the command on one line.
- If the `SET TIMING` command is set to `ON`, the elapsed time information is displayed.

8.54.3. Examples

- This command displays the value set for the markup option:

```
SQL> SHOW MARKUP

MARKUP RAW

Elapsed time:00:00:00:078
```

8.55. SHOW PARAM Command

The `SHOW PARAM` command displays the parameters that are set in the current TrafCI session.

8.55.1. Syntax

```
SHOW PARAM
```

8.55.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- If the `SET TIMING` command is set to `ON`, the elapsed time information is displayed.

8.55.3. Example

- This command shows that parameters that are set for the current session:

```
SQL> SHOW PARAM

lastname GREEN
dn 1500
sal 40000.00
```

- This command shows that when no parameters exist, the `SHOW PARAM` command displays an error message:

```
SQL> SHOW PARAM

No parameters found.
```

For more information, [Display Session Parameters](#).

8.56. SHOW PREPARED Command

The `SHOW PREPARED` command displays the prepared statements in the current TrafCI session. If a pattern is specified, then all prepared statements matching the prepared statement name pattern are displayed. By default, all prepared statements in the current session are displayed.

8.56.1. Syntax

```
SHOW PREPARED
```

8.56.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- If the `SET TIMING` command is set to `ON`, the elapsed time information is displayed.

8.56.3. Examples

- This command shows all the prepared statements, by default:

```
SQL> SHOW PREPARED

S1
    SELECT * FROM t1
S2
    SELECT * FROM student
T1
    SELECT * FROM test123

SQL> SHOW PREPARED s%

S1
    SELECT * FROM t1
S2
    SELECT * FROM student

SQL> SHOW PREPARED t%

T1
    SELECT * FROM test123
```

8.57. SHOW RECCOUNT Command

The `SHOW RECCOUNT` command displays the record count of the previously executed SQL statement. If the previously executed command was an interface command, then TrafCI returns zero.

8.57.1. Syntax

```
SHOW RECCOUNT
```

8.57.2. Considerations

- You must enter the command on one line. The command does not need an SQL terminator.
- If the `SET TIMING` command is set to `ON`, the elapsed time information is displayed.

8.57.3. Examples

- This command displays the record count of the SQL statement that was executed last:

```
SQL> SELECT * FROM employee;  
SQL> SHOW RECCOUNT  
  
RECCOUNT 62
```

8.58. SHOW REMOTEPROCESS Command

The `SHOW REMOTEPROCESS` command displays the process name of the DCS server that is handling the current connection.

8.58.1. Syntax

```
SHOW REMOTEPROCESS
```

8.58.2. Considerations

- You must enter the command on one line. The command does not need an SQL terminator.
- The command does not need an SQL terminator.

8.58.3. Example

- This command displays the process name, `\g4t3028.houston.host.com:0.$Z0000M2`, of the DCS server that is handling the current connection:

```
SQL> SHOW REMOTEPROCESS

REMOTE PROCESS \g4t3028.houston.host.com:0.$Z0000M2

SQL>
```

8.59. SHOW SCHEMA Command

The `SHOW SCHEMA` command displays the current schema of the TrafCI session.

8.59.1. Syntax

```
SHOW SCHEMA
```

8.59.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- If the `SET TIMING` command is set to `ON`, the elapsed time information is displayed.

8.59.3. Example

- This command shows that the current schema of the session is `PERSNL`:

```
SQL> SHOW SCHEMA  
  
SCHEMA PERSNL
```

For more information, see [Set and Show the Current Schema](#).

8.60. SHOW SESSION Command

`SHOW SESSION` or `SESSION` displays attributes of the current TrafCI session. You can also use the `ENV` command to perform the same function.

8.60.1. Syntax

```
[SHOW] SESSION
```

8.60.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- If the `SET TIMING` command is set to `ON`, the elapsed time information is displayed.
- `SHOW SESSION` or `SESSION` displays these attributes:

Attribute	Description
COLSEP	Current column separator, which is used to control how query results are displayed. For more information, SET COLSEP Command .
HISTOPT	Current history options, which controls how the commands are added to the history buffer. For more information, see SET HISTOPT Command .
IDLETIMEOUT	Current idle timeout value, which determines when the session expire after a period of inactivity. By default, the idle timeout is 30 minutes. For more information, see Set and Show Session Idle Timeout Value and SET IDLETIMEOUT Command .
LIST_COUNT	Current list count, which is the maximum number of rows that can be returned by <code>SELECT</code> statements. By default, the list count is all rows. For more information, see SET LIST_COUNT Command .
LOG FILE	Current log file and the directory containing the log file. By default, logging during a session is turned off. For more information, see Log Output , and LOG Command .
LOG OPTIONS	Current logging options. By default, logging during a session is turned off, and this attribute does not appear in the output. For more information, see the LOG Command or SPOOL Command .
MARKUP	Current markup option selected for the session. The default option is <code>RAW</code> . For more information, see SET MARKUP Command ".
PROMPT	Current prompt for the session. For example, the default is <code>SQL></code> . For more information, see Customize the Standard Prompt and SET PROMPT Command .

Attribute	Description
SCHEMA	<p>Current schema. The default is <code>USR</code>.</p> <p>For more information, see Set and Show the Current Schema.</p>
SERVER	<p>Host name and port number that you entered when logging in to the database platform.</p> <p>For more information, see Log In to Database Platform.</p>
SQLTERMINATOR	<p>Current SQL statement terminator. The default is a semicolon (<code>;</code>).</p> <p>For more information, see Set and Show the SQL Terminator and SHOW SQLTERMINATOR Command.</p>
STATISTICS	<p>Current setting (<code>on</code> or <code>off</code>) of statistics.</p> <p>For more information, see the SET STATISTICS Command.</p>
TIME	<p>Current setting (<code>on</code> or <code>off</code>) of the local time as part of the prompt. When this command is set to <code>on</code>, military time is displayed. By default, the local time is <code>off</code>.</p> <p>For more information, see Customize the Standard Prompt and SET TIME Command.</p>
TIMING	<p>Current setting (<code>on</code> or <code>off</code>) of the elapsed time. By default, the elapsed time is <code>off</code>.</p> <p>For more information, see Display the Elapsed Time and SET TIMING Command.</p>
USER	<p>User name that you entered when logging in to the database platform.</p> <p>For more information, see Log In to Database Platform.</p>

8.60.3. Examples

- This SHOW SESSION command displays the attributes of the current session:

```
SQL> SHOW SESSION

COLSEP           " "
HISTOPT          DEFAULT [No expansion of script files]
IDLETIMEOUT      0 min(s) [Never Expires]
LIST_COUNT       0 [All Rows]
LOG FILE         c:\session.txt
LOG OPTIONS      APPEND,CMDTEXT ON
MARKUP           RAW
PROMPT           SQL>
SCHEMA           SEABASE
SERVER           sqws135.houston.host.com:23400
SQLTERMINATOR    ;
STATISTICS       OFF
TIME             OFF
TIMING           OFF
USER             user1
```

- This SESSION command shows the effect of setting various session attributes:

```
SQL> SESSION

COLSEP           " "
HISTOPT          DEFAULT [No expansion of script files]
IDLETIMEOUT      30 min(s)
LIST_COUNT       0 [All Rows]
LOG              OFF
MARKUP           RAW
PROMPT           SQL>
SCHEMA           SEABASE
SERVER           sqws135.houston.host.com:23400
SQLTERMINATOR    ;
STATISTICS       OFF
TIME             OFF
TIMING           OFF
USER             user1

SQL>
```

8.61. SHOW SQLPROMPT Command

The `SHOW SQLPROMPT` command displays the value of the SQL prompt for the current TrafCI session.

8.61.1. Syntax

```
SHOW SQLPROMPT
```

8.61.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- If the `SET TIMING` command is set to `ON`, the elapsed time information is displayed.

8.61.3. Example

- This command shows that the SQL prompt for the current session is `SQL>`:

```
SQL> SHOW SQLPROMPT
SQLPROMPT SQL>
```

8.62. SHOW SQLTERMINATOR Command

The `SHOW SQLTERMINATOR` command displays the SQL statement terminator of the current TrafCI session.

8.62.1. Syntax

```
SHOW SQLTERMINATOR
```

8.62.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- If the `SET TIMING` command is set to `ON`, the elapsed time information is displayed.

8.62.3. Example

- This command shows that the SQL terminator for the current session is a period (.):

```
SQL> SHOW SQLTERMINATOR

SQLTERMINATOR .
```

For more information, see [Set and Show the SQL Terminator](#).

8.63. SHOW STATISTICS Command

The `SHOW STATISTICS` command displays if statistics has been enabled or disabled for the current session.

8.63.1. Syntax

```
SHOW STATISTICS
```

8.63.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- If the `SET TIMING` command is set to `ON`, the elapsed time information is displayed.

8.63.3. Example

- This command shows `SHOW STATISTICS` disabled and then enabled:

```
SQL> SHOW STATISTICS

STATISTICS OFF

SQL> SET STATISTICS ON
SQL> SHOW STATISTICS

STATISTICS ON
```

8.64. SHOW TIME Command

The `SHOW TIME` command displays whether the setting for the local time in the interface prompt is `ON` or `OFF`.

8.64.1. Syntax

```
SHOW TIME
```

8.64.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- If the `SET TIMING` command is set to `ON`, the elapsed time information is displayed.

8.64.3. Example

- This command shows that the setting for the local time in the SQL prompt is `OFF`:

```
SQL> SHOW TIME  
  
TIME OFF
```

8.65. SHOW TIMING Command

The `SHOW TIMING` command displays whether the setting for the elapsed time is `ON` or `OFF`.

8.65.1. Syntax

```
SHOW TIMING
```

8.65.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- If the `SET TIMING` command is set to `ON`, the elapsed time information is displayed.

8.65.3. Example

- This command displays the elapsed time information because the `SET TIMING` command is enabled:

```
SQL> SET TIMING ON
SQL> SHOW TIME

TIME OFF

Elapsed :00:00:00.000
```

8.66. SPOOL Command

The `SPOOL` command logs the entered commands and their output from TrafCI to a log file.

8.66.1. Syntax

```
SPOOL { ON [ CLEAR, QUIET, CMDTEXT { ON | OFF } ]
      | log-file [ CLEAR, QUIET, CMDTEXT { ON | OFF } ]
      | OFF
      }
```

- `ON`

starts the logging process and records information in the `sqlspool.lst` file in the ``bin` directory.

- `ON CLEAR`

instructs TrafCI to clear the contents of the `sqlspool.lst` file before logging new information to the file.

- `QUIET`

specifies that the command text is displayed on the screen, but the results of the command are written only to the log file and not to the screen.

- `CMDTEXT ON`

specifies that the command text and the log header are displayed in the log file.

- `CMDTEXT OFF`

specifies that the command text and the log header are not displayed in the log file.

- `log-file`

is the name of a log file into which TrafCI records the entered commands and their output. If you want the log file to exist outside the local directory where you launch TrafCI (by default, the `bin` directory), then specify the full directory path of the log file. The log file does not need to exist, but the specified directory must exist before you execute the `SPOOL` command.

- `log-file CLEAR`

instructs TrafCI to clear the contents of the specified `log-file` before logging new information to the file.

- OFF

stops the logging process.

8.66.2. Considerations

- You must enter the command on one line. The command does not require an SQL terminator.
- Use a unique name for each log file to avoid writing information from different TrafCI sessions into the same log file.

8.66.3. Examples

- This command starts the logging process and records information to the `sqlspool.lst` file in the `bin` directory:

```
SQL> SPOOL ON
```

- This command starts the logging process and appends new information to an existing log file, `persnl_updates.log`, in the local directory (the same directory where you are running TrafCI):

```
SQL> SPOOL persnl_updates.log
```

- This command starts the logging process and appends new information to a log file, `sales_updates.log`, in the specified directory on a Windows workstation:

```
SQL> SPOOL c:\log_files\sales_updates.log
```

- This command starts the logging process and appends new information to a log file, `sales_updates.log`, in the specified directory on a Linux or UNIX workstation:

```
SQL> SPOOL ./log_files/sales_updates.log
```

- This command starts the logging process and clears existing information from the log file before logging new information to the file:

```
SQL> SPOOL persnl_ddl.log CLEAR
```

- This command starts the logging process and records information to the `sqlspool.lst` file in the bin directory:

```
SQL> LOG ON
```

- This command starts the logging process and appends new information to an existing log file, `persnl_updates.log`, in the local directory (the same directory where you are running TrafCI):

```
SQL> LOG persnl_updates.log
```

- This command starts the logging process and appends new information to a log file, `sales_updates.log`, in the specified directory on a Windows workstation:

```
SQL> LOG c:\log_files\sales_updates.log
```

- This command starts the logging process and appends new information to a log file, `sales_updates.log`, in the specified directory on a Linux or UNIX workstation:

```
SQL> LOG ./log_files/sales_updates.log
```

- This command starts the logging process and clears existing information from the log file before logging new information to the file:

```
SQL> LOG persnl_ddl.log CLEAR
```

- This command start the logging process, clears existing information from the log file, and specifies that the command text and log header is not displayed in the log file:

```
SQL> LOG c:\temp\a.txt clear, CMDTEXT OFF
SQL> SELECT * FROM trafodion.toi.job
+>;
```

```
JOBCODE JOBDESC
-----
      100 MANAGER
      450 PROGRAMMER
      900 SECRETARY
      300 SALESREP
      500 ACCOUNTANT
      400 SYSTEM ANALYST
      250 ASSEMBLER
      420 ENGINEER
      600 ADMINISTRATOR
      200 PRODUCTION SUPV
```

```
--- 10 row(s) selected.
```

```
SQL> LOG OFF
```

Output of c:\temp\a.txt

```
JOBCODE JOBDESC
-----
      100 MANAGER
      450 PROGRAMMER 900 SECRETARY
      300 SALESREP
      500 ACCOUNTANT
      400 SYSTEM ANALYST
      250 ASSEMBLER
      420 ENGINEER
      600 ADMINISTRATOR
      200 PRODUCTION SUPV
```

```
--- 10 row(s) selected
```

- This command start the logging process, clears existing information from the log file, and specifies that no output appears on the console window:

```
SQL> LOG c:\temp\b.txt CLEAR, CMDTEXT OFF, QUIET
SQL> SELECT *
+>FROM trafodion.toi.job;
SQL> LOG OFF
```

Output of c:\temp\b.txt

```
=====
JOBCODE JOBDESC
-----
      100 MANAGER
      450 PROGRAMMER
      900 SECRETARY
      300 SALESREP
      500 ACCOUNTANT
      400 SYSTEM ANALYST
      250 ASSEMBLER
      420 ENGINEER
      600 ADMINISTRATOR
      200 PRODUCTION SUPV

--- 10 row(s) selected
```

- This command stops the logging process:

```
SQL> LOG OFF
```

For more information, see [Log Output](#).

8.67. VERSION Command

The `VERSION` command displays the build versions of the Trafodion database, Trafodion Connectivity Service, Trafodion JDBC Type 4 Driver, and TrafCI.

8.67.1. Syntax

```
VERSION
```

8.67.2. Considerations

You must enter the command on one line. The command does not require an SQL terminator.

8.67.3. Example

- This command shows versions of the Trafodion database, Trafodion Connectivity Service, Trafodion JDBC Type 4 Driver, and TrafCI:

```
SQL> VERSION

Trafodion Platform           : Release 0.8.0
Trafodion Connectivity Services : Version 1.0.0 Release 0.8.0
Trafodion JDBC Type 4 Driver   : Traf_JDBC_Type4_Build_40646)
Trafodion Command Interface    : TrafCI_Build_40646

SQL>
```

- If TrafCI is started with the `-noconnect` parameter, the `VERSION` command displays only TrafCI and the Trafodion JDBC Type 4 Driver versions.

```
C:\Program Files (x86)\Apache Software Foundation\Trafodion Command Interface\bin>
TRAFCI -noconnect
```

```
